### Testing the SNMP Configuration

After you configure SNMP on the appliance, you can do the following to test your SNMP configuration:

- From the Grid tab, select the Grid Manager tab -> Members tab -> Grid_member check box, and then select Test SNMP from the Toolbar.
The appliance sends a “test trap” string to the trap receiver and displays a confirmation message at the top of the screen if your SNMP configuration is properly set up. If your SNMP configuration is not complete or if it is invalid, the appliance displays an error message. You can check your configuration and try again.

The following is a sample test trap that the trap receiver can get:

```
2011-04-04 17:37:14 10.32.2.80 [UDP: 10.32.2.80]:49244->[10.32.2.80]]:
SNMPv2-MIB::snmpTrapOID.0 = OID: SNMPv2-MIB::snmpTrapOID
SNMPv2-MIB::sysName.0 = STRING: 'Test trap'
```

SNMP MIB Hierarchy

In addition to implementing its own enterprise MIBs, Infoblox supports the standard MIBs defined in RFC-1213, Management Information Base for Network Management of TCP/IP-based internets: MIB-II.

The Infoblox MIBs are part of a universal hierarchical structure, usually referred to as the MIB tree. The MIB tree has an unlabeled root with three subtrees. Figure 39.2 illustrates the branch of the MIB tree that leads to the Infoblox enterprise MIBs. Each object in the MIB tree has a label that consists of a textual description and an OID (object identifier). An OID is a unique dotted-decimal number that identifies the location of the object in the MIB tree. Note that all OIDs begin with a dot (.) to indicate the root of the MIB tree.

As shown in Figure 39.2, Infoblox is a branch of the Enterprise subtree. IANA (Internet Assigned Numbers Authority) administers the Enterprise subtree, which is designated specifically for vendors who define their own MIBs. The IANA-assigned enterprise number of Infoblox is 7779; therefore, the OIDs of all Infoblox MIB objects begin with the prefix .1.3.6.1.4.1.7779. In addition, IB-DNSSERV and IB-DHCPserv are branches of the Enterprise subtree as well.

The Infoblox SNMP subtree branches down through two levels, ibProduct and ibOne, to the Infoblox MIBs: ibTrap, ibPlatformOne, ibDNSOne, and ibDHCPOne. The ibTrap MIB defines the traps that NIOS appliances send, and the ibPlatformOne, ibDNSOne, and ibDHCPOne MIBs provide information about the appliance. For detailed information about these MIBs, see Infoblox MIBs.
The Infoblox MIB objects were implemented according to the guidelines in RFCs 1155 and 2578. They specify two types of macros for defining MIB objects: OBJECT-TYPE and NOTIFICATION-TYPE. These macros contain clauses that describe the characteristics of an object, such as its syntax and its status. OBJECT-TYPE macros describe MIB objects, and NOTIFICATION-TYPE macros describe objects used in SNMP traps. Each object in the ibPlatformOne, ibDNSOne, and ibDHCPOne MIBs contains the following clauses from the OBJECT-TYPE macro:

- **OBJECT-TYPE**: Provides the administratively-assigned name of the object.
- **SYNTAX**: Identifies the data structure of the object, such as integers, counters, and octet strings.
- **MAX-ACCESS**: Identifies the type of access that a management station has to the object. All Infoblox MIB objects provide read-only access.
- **STATUS**: Identifies the status of the object. Values are current, obsolete, and deprecated.
- **DESCRIPTION**: Provides a textual description of the object.
- **INDEX or AUGMENTS**: An object that represents a conceptual row must have either an INDEX or AUGMENTS clause that defines a key for selecting a row in a table.
- **OID**: The dotted decimal object identifier that defines the location of the object in the universal MIB tree.

The ibTrap MIB defines the SNMP traps that a NIOS appliance can send. Each object in the ibTrap MIB contains the following clauses from the NOTIFICATION-TYPE macro:

- **NOTIFICATION-TYPE**: Provides the administratively-assigned name of the object.
- OBJECTS: Provides an ordered list of MIB objects that are in the trap.
- STATUS: Identifies the status of the object. Values are current, obsolete, and deprecated.
- DESCRIPTION: Provides the notification information.

System Object IDs

Infoblox uses the SNMP system object identifier `sysObjectID` to identify Infoblox appliances. The following is a definition of `sysObjectID` from the SNMPv2 MIB, `Management Information Base (MIB)` for the `Simple Network Management Protocol (SNMP)`:

<table>
<thead>
<tr>
<th>OBJECT-TYPE</th>
<th>sysObjectID</th>
</tr>
</thead>
<tbody>
<tr>
<td>SYNTAX</td>
<td>Object Identifier</td>
</tr>
<tr>
<td>MAX-ACCESS</td>
<td>read-only</td>
</tr>
<tr>
<td>STATUS</td>
<td>current</td>
</tr>
</tbody>
</table>
| DESCRIPTION  | "The vendor's authoritative identification of the network management subsystem contained in the entity. This value is allocated within the SMI enterprises subtree (1.3.6.1.4.1) and provides an easy and unambiguous means for determining 'what kind of box' is being managed. For example, if vendor 'Flintstones,Inc.' was assigned the subtree 1.3.6.1.4.1.424242, it could assign the identifier 1.3.6.1.4.1.424242.1.1 to its 'Fred Router'."

Table 39.3 lists the enterprise IDs and their corresponding Infoblox hardware platforms that an SNMP query can return when you request the `sysObjectID` value. Note that the IDs shown in the table do not include 1.3.6.1.4.1.7779.1. (the `infobloxProducts` prefix).

Infoblox MIBs

You can configure a NIOS appliance as an SNMP-managed device so that an SNMP management station can send queries to the appliance and retrieve information from its MIBs. Perform the following tasks to access the Infoblox MIBs:

1. Configure a NIOS appliance to accept queries, as described in [Configuring SNMPv3 Users](#).
2. Load the MIB files onto the management system. To obtain the latest Infoblox MIB files:
   a. From the Data Management tab, select the Grid tab -> Grid Manager tab, and then select Download -> SNMP MIBs from the Toolbar.
   b. In the Save As dialog box, navigate to a directory to which you want to save the MIBs.
   c. Click Save.
3. Use a MIB browser or SNMP management application to query the objects in each MIB.

The NIOS appliance allows read-only access to the MIBs. This is equivalent to the Get and Get Next operations in SNMP.

Loading the Infoblox MIBs

If you are using an SNMP manager toolkit with strict dependency checking, you must download the following Infoblox MIBs in the order they are
1. IB-SMI-MIB.txt  
2. IB-TRAP-MIB.txt  
3. IB-PLATFORMONE-MIB.txt  
4. IB-DNSONE-MIB.txt  
5. IB-DHCPOSE-MIB.txt  
6. IB-DNSSERV-MIB.txt  
7. IB-DHCPSERV-MIB.txt  
8. IB-DHCPV6ONE-MIB.txt

In addition, if the SNMP manager toolkit you use requires a different MIB file naming convention, you can rename the MIB files accordingly.

NET-SNMP MIBs

NIOS appliances support NET-SNMP (formerly UCD-SNMP), a collection of applications used to implement the SNMP protocol. The NET-SNMP MIBs provide the top-level infrastructure for the SNMP MIB tree. They define, among other things, the objects in the SNMP traps that the agent sends when the SNMP engine starts and stops. For information about NET-SNMP and the MIB files distributed with NET-SNMP, refer to [http://net-snmp.sourceforge.net/](http://net-snmp.sourceforge.net/).

For SNMP traps to function properly, you must download the following NET-SNMP MIBs directly from [http://net-snmp.sourceforge.net/docs/mibs](http://net-snmp.sourceforge.net/docs/mibs):

- NET-SNMP-MIB
- UCD-SNMP-MIB

**Note:** Ensure that you save the MIBs as text files in the directory to which you save all the other MIB files.

BGP4 MIB

Infoblox supports BGP4 (Border Gateway Protocol) for DNS anycast addressing. BGP is configured to send SNMP traps to neighboring routers, as defined in [RFC4273](https://tools.ietf.org/html/rfc4273). You must enable and configure the SNMP trap receiver on the Grid member for the member to send SNMP traps. For information, see [SNMP MIB Hierarchy](#).

The BGP protocol service is configured to send SNMP queries about BGP runtime data. The information is returned using the following OIDs and definitions:

<table>
<thead>
<tr>
<th>OID</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>1.3.6.1.2.1.15.900.1.1</td>
<td>Number of peers</td>
</tr>
<tr>
<td>1.3.6.1.2.1.15.900.1.2</td>
<td>Number of active peers</td>
</tr>
<tr>
<td>1.3.6.1.2.1.15.900.1.3</td>
<td>Number of AS path entries</td>
</tr>
<tr>
<td>1.3.6.1.2.1.15.900.1.4</td>
<td>Number of BGP community entries</td>
</tr>
<tr>
<td>1.3.6.1.2.1.15.900.1.5</td>
<td>Total number of prefixes</td>
</tr>
</tbody>
</table>

For each configured BGP peer (a, b, c, d), the information is returned using the following OIDs and definitions:

<table>
<thead>
<tr>
<th>OID</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>1.3.6.1.2.1.15.900.1.9.a.b.c.d.1</td>
<td>IP address: same as a.b.c.d</td>
</tr>
<tr>
<td>1.3.6.1.2.1.15.900.1.9.a.b.c.d.2</td>
<td>State: 0=down, 1=up</td>
</tr>
<tr>
<td>1.3.6.1.2.1.15.900.1.9.a.b.c.d.3</td>
<td>ASN</td>
</tr>
<tr>
<td>1.3.6.1.2.1.15.900.1.9.a.b.c.d.4</td>
<td>Prefixes</td>
</tr>
<tr>
<td>1.3.6.1.2.1.15.900.1.9.a.b.c.d.5</td>
<td>Up/Down time</td>
</tr>
</tbody>
</table>

ibTrap MIB

NIOS appliances send SNMP traps when events, internal process failures, or critical service failures occur. The ibTrap MIB defines the types of traps that a NIOS appliance sends and the value that each MIB object represents. The Infoblox SNMP traps report objects which the ibTrap MIB defines. Figure 39.3 illustrates the ibTrap MIB structure. It provides the OID and textual description for each object.

**Note:** OIDs shown in the illustrations and tables in this section do not include the prefix .1.3.6.1.4.1.7779.
The ibTrap MIB comprises two trees, ibTrapOneModule and ibNotificationVarBind. The ibTraponeModule tree contains objects for the types of traps that a NIOS appliance sends. The ibNotificationVarBind tree contains objects that the Infoblox SNMP traps report. You cannot send queries for the objects in this MIB module. The objects are used only in the SNMP traps.

**Figure 39.3 ibTrapOne MIB Structure**

![ibTrap One MIB Structure Diagram]

Interpreting Infoblox SNMP Traps

Depending on the SNMP management application your management system uses, the SNMP traps you receive may list the OIDs for all relevant MIB objects from both the ibTrapOneModule and ibNotificationVarBind trees. For OIDs that have string values, the trap lists the text. For OIDs that contain integers, you can use the tables in this section to find out the values. Some SNMP management applications list only the object names and their corresponding values in the SNMP traps. Whether or not your SNMP management application lists OIDs, you can use the tables in this section to find out the corresponding value and definition for each MIB object.

The following is a sample trap a NIOS appliance sends:

```
0:00:10.80 SNMPv2-MIB::snmpTrapOID.0 = OID: SNMPv2-SMI::enterprises.7779.3.1.1.1.4.0
SNMPv2-SMI::enterprises.7779.3.1.1.2.1.0 = STRING: "10.35.1.156"
```
The sample trap lists the OIDs and their corresponding values that can help you identify the cause of an event or problem. To identify the possible cause and recommended actions for the trap, use the ibTrapDesc tables. For information, see ibTrapDesc (OID 3.1.1.1.2.11.0).

You can interpret the sample trap as follows:

Using the ibTrapOneModule table, you find out OID 7779.3.1.1.1.4.0 represents an Object State Change trap. This trap includes the following objects: ibNodeName, ibObjectName, ibPreviousState, ibCurrentState, and ibtrapDesc. For each object, the trap displays the OID and its corresponding value. The following is how you can interpret the rest of the trap:

- **ibNodeName (OID 7779.3.1.1.1.2.1.0)**
  - The statement "7779.3.1.1.1.2.1.0 = STRING: "10.35.1.156" SNMPv2-SMI::enterprises.*" tells you the IP address of the appliance on which the trap occurred.

- **ibObjectName (OID 7779.3.1.1.1.2.3.0)**
  - The statement "7779.3.1.1.1.2.3.0 = STRING: "ntp_sync" SNMPv2-SMI::enterprises.*" tells you the MIB object ibObjectName, which is the name of the object for which the trap was generated, has a value of "ntp_sync" that indicates NTP synchronization issues.

- **ibPreviousState (OID 7779.3.1.1.1.2.9.0)**
  - The statement "7779.3.1.1.1.2.9.0 = INTEGER: 15 SNMPv2-SMI::enterprises.*" tells you the MIB object ibPreviousState, which indicates the previous state of the appliance, has a value of 15. Using the ibPreviousState and ibCurrentState Values table, you know that 15 represents "ntp-sync-up", which means the NTP server was up and running.

- **ibCurrentState (OID 7779.3.1.1.1.2.10.0)**
  - The statement "7779.3.1.1.1.2.10.0 = INTEGER: 16 SNMPv2-SMI::enterprises.*" tells you the MIB object ibCurrentState, which indicates the current state of the appliance, has a value of 16. Using the ibPreviousState and ibCurrentState Values table, you know that 16 represents "ntp-sync-down", which means the NTP server is now out of sync.

- **ibTrapDesc (OID 7779.3.1.1.1.2.11.0)**
  - The last statement "7779.3.1.1.1.2.11.0 = STRING: "The NTP service is out of synchronization." states the description of the trap. Using the Object State Change Traps table for ibTrapDesc, you can find out the trap description and recommended actions for this problem.

### Types of Traps (OID 3.1.1.1.1)

ibTrapOneModule defines the types of traps that the NIOS appliance can send. There are five types of SNMP traps. Table 39.4 describes the types of traps and their objects in the ibTrapOneModule tree.

**Note:** Some SNMP traps for ibThresholdCrossingEvent, ibStateChangeEvent, ibProcStartStopTrap, and ibRevokedLicenseTrap do not have an associated ibProbableCause. The following table lists traps that provide ibProbableCause and those that do not have an ibProbableCause value.

#### Table 39.4 ibTrapOneModule

Threshold Crossing

The NIOS appliance generates this trap when any of the following events occur:
- System memory or disk usage exceeds 90%.
- CPU usage exceeds the trigger value for 15 seconds.
- A problem occurs when the Grid Master replicates its database to its Grid members.
- DHCP address usage crosses a watermark threshold. For more information about tracking IP address usage, see Threshold Crossing Traps.
- The number or percentage of the DNS security alerts exceeds the thresholds of the DNS security alert triggers.

This trap includes the following objects:
- ibNodeName
- ibTrapSeverity
- ibObjectName (threshold name)
- ibCurThresholdvalue
- ibThresholdHigh
- ibThresholdLow
- ibTrapDesc

For a list of trap descriptions, see Threshold Crossing Traps.

Object State Change

The NIOS appliance generates this trap when there is a change in its state, such as:
- The link to one of the configured ports goes down, and then goes back up again.
- A failover occurs in an HA (high availability) pair configuration.
- A member connects to the Grid Master.
- An appliance in a Grid goes offline. This trap includes the following objects:
  - ibNodeName
  - ibTrapSeverity
  - ibObjectName
  - ibPreviousState
  - ibCurrentState
  - ibTrapDesc

For a list of possible trap descriptions, see Object State Change Traps.

Process Started and Stopped

The NIOS appliance generates this type of trap when any of the following events occur:
- When you enable HTTP redirection.
- When you change the HTTP access setting.
- When you change the HTTP session time out setting.
- When a failover occurs in an HA pair configuration.

This trap includes the following objects:
- ibNodeName
- ibSubsystemName
- ibTrapDesc

For a list of possible trap descriptions, see Process Started and Stopped Traps.

ibRevokedLicenseTrap

The NIOS appliance generates this trap when a license is revoked. This trap includes the following objects:
- ibNodeName
- ibSubsystemName
- ibTrapDesc

ibOperationTrap

The NIOS appliance generates this trap when a software operation is noteworthy. This trap includes the following objects:
- ibNodeName
- ibTrapSeverity
- ibSubsystemName
- ibProbableCause
- ibTrapDesc

Each SNMP trap contains information about the event or the problem. The Infoblox SNMP traps include MIB objects and their corresponding values from the ibNotificationVarBind module. Table 39.5 describes the objects in the ibNotificationVarBind module.

Table 39.5 ibNotificationVarBind (OID 3.1.1.1.2)

<table>
<thead>
<tr>
<th>OID</th>
<th>MIB Object (Type)</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>3.1.1.1.2.1.0</td>
<td>ibNodeName (DisplayString)</td>
<td>The IP address of the appliance on which the trap occurs. This may or may not be the same as the appliance that sends the trap. This object is used in all types of traps.</td>
</tr>
<tr>
<td>3.1.1.1.2.2.0</td>
<td>ibTrapSeverity (Integer)</td>
<td>The severity of the trap. There are five levels of severity. See Trap Severity (OID 3.1.1.1.2.2.0) for details.</td>
</tr>
</tbody>
</table>

Note: The OIDs shown in the following table do not include the prefix ".1.3.6.1.4.1.7779.".
3.1.1.2.3.0 ibObjectName (DisplayString)
The name of the object for which the trap was generated. This is used in the Equipment Failure traps, Threshold Crossing Event traps, and the Object State Change traps. The following shows what this object represents depending on the type of traps:
- Equipment Failure traps: The equipment name.
- Threshold Crossing Event traps: The object name of the trap.
- State Change traps: The object that changes state.

3.1.1.2.4.0 ibProbableCause (Integer)
The probable cause of the trap. See ibProbableCause Values for the definitions of each value.

3.1.1.2.5.0 ibSubsystemName (DisplayString)
The subsystem for which the trap was generated, such as NTP or SNMP. This object is used in the Processing and Software Failure traps and the Process Start and Stop traps. See ibSubsystemName Values (OID 3.1.1.1.2.5.0) for definitions.

3.1.1.2.6.0 ibCurThresholdValue (Integer)
The current value of the threshold counter. This object is used in the Threshold Crossing traps.

3.1.1.2.7.0 ibThresholdHigh (Integer)
This object is used in Threshold Crossing traps. For CPU usage, this is the trigger value of the SNMP trap. For DHCP address usage, this is the value of the high watermark. This only applies when the appliance sends a trap to indicate that DHCP address usage is above the configured high watermark value for a DHCP address range. For more information, see Threshold Crossing Traps.

3.1.1.2.8.0 ibThresholdLow (Integer)
This object is used in Threshold Crossing traps. For CPU usage, this is the reset value of the SNMP trap. For DHCP address usage, this is the value for the low watermark. This only applies when the appliance sends a trap to indicate that DHCP address usage went below the configured low watermark value for a DHCP address range. For more information, see Threshold Crossing Traps.

3.1.1.2.9.0 ibPreviousState (Integer)
The previous state of the appliance. This object is used in the Object State Change traps. See ibPreviousState (OID 3.1.1.1.2.9.0) and ibCurrentState (OID 3.1.1.1.2.10.0) for definitions of each value.

3.1.1.2.10.0 ibCurrentState (Integer)
The current state of the appliance. This object is used in the Object State Change traps. See ibPreviousState (OID 3.1.1.1.2.9.0) and ibCurrentState (OID 3.1.1.1.2.10.0) for the definition of each value.

3.1.1.2.11.0 ibTrapDesc (DisplayString)
The description of the trap. This object is used in all types of traps. See ibTrapDesc (OID 3.1.1.1.2.11.0) for the description, possible cause, and recommended actions for each Infoblox SNMP trap.

### Trap Severity (OID 3.1.1.1.2.2.0)
The object ibTrapSeverity defines the severity level for each Infoblox SNMP trap. There are five levels of severity.

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>

<tr>
<td>4</td>
<td>Major: Event that requires user intervention and assistance from Infoblox Technical Support.</td>
</tr>
<tr>
<td>5</td>
<td>Critical: Problem that affects services and system operations, and requires assistance from Infoblox Technical Support.</td>
</tr>
</tbody>
</table>

### ibProbableCause Values (OID 3.1.1.1.2.4.0)
Table 39.6 lists the values that are associated with the object ibProbableCause (OID 3.1.1.1.2.4.0). These values provide information about the events such as hardware, software for process failures, that trigger SNMP traps.

Table 39.6 ibProbableCause Values

**ibSubsystemName Values (OID 3.1.1.1.2.5.0)**

Table 39.7 lists the values that are associated with the object `ibSubsystemName` (OID 3.1.1.1.2.5.0). These values provide information about the subsystems that trigger the traps.

<table>

The `ibTrapDesc` object lists the trap messages of all Infoblox SNMP traps. This section lists all the SNMP traps by their trap types. Each trap table describes the trap message, severity, cause, and recommended actions.

**Note**: Contact Infoblox Technical Support for assistance when the recommended actions do not resolve the problems.

### Equipment Failure Traps

<table>
<thead>
<tr>
<th>OId 3.1.1.1.2.11.0</th>

</thead>
<tbody>
<tr>
<td>The syslog backup process is successful.</td>
<td>Informational</td>
<td>Rotated syslog files are uploaded successfully to the external backup server.</td>
<td>No action is required.</td>
</tr>
<tr>
<td>The syslog backup process failed.</td>
<td>Major</td>
<td>Failed to forward the rotated syslog files to the external backup server.</td>
<td>Review the syslog messages to identify the possible cause of this problem.</td>
</tr>
</tbody>
</table>

### Processing and Software Failure Traps

**Note:** The ibSubsystemName object is associated with certain traps of the Processing and Software Failure traps. Therefore, you cannot map all the traps of the Processing and Software Failure traps with the ibSubsystemName. If there is no value in the ibSubsystemName, then it belongs to the N/A category. For more information on the values for the ibSubsystemName, see the Table 39.7

<table>
<thead>
<tr>
<th>Event Description</th>
<th>Severity</th>
<th>Description</th>

</tbody>
</table>

### TFTP and FTPD Failure

<table>
<thead>
<tr>
<th>Failure Description</th>
<th>Sev.</th>
<th>Cause</th>
<th>Solution</th>
</tr>
</thead>
<tbody>
<tr>
<td>A TFTP daemon failure has occurred.</td>
<td>Critical</td>
<td>The tftpd process failed.</td>
<td>Review the syslog file to identify the possible cause of this problem.</td>
</tr>
<tr>
<td>An FTP daemon failure has occurred.</td>
<td>Critical</td>
<td>The ftpd process failed.</td>
<td>Review the syslog file to identify the possible cause of this problem.</td>
</tr>
</tbody>
</table>

### HTTP File Distribution, monitored at 10 second intervals

<table>
<thead>
<tr>
<th>Failure Description</th>
<th>Sev.</th>
<th>Cause</th>
<th>Solution</th>
</tr>
</thead>
<tbody>
<tr>
<td>An HTTP file distribution daemon failure has occurred.</td>
<td>Critical</td>
<td>The HTTP file distribution process failed.</td>
<td>Review the syslog file to identify the possible cause of this problem.</td>
</tr>
</tbody>
</table>

### DNS ONE quagga Processes (zebra & ospfd)

<table>
<thead>
<tr>
<th>Failure Description</th>
<th>Sev.</th>
<th>Cause</th>
<th>Solution</th>
</tr>
</thead>
<tbody>
<tr>
<td>An OSPF routing daemon failure has occurred.</td>
<td>Critical</td>
<td>Either the zebra process or the ospf process failed. Both the zebra and ospf process belongs to ospf subsystem.</td>
<td>Review the syslog file to identify the possible cause of this problem.</td>
</tr>
</tbody>
</table>

### Backup Failure

<table>
<thead>
<tr>
<th>Failure Description</th>
<th>Sev.</th>
<th>Cause</th>
<th>Solution</th>
</tr>
</thead>
</table>
| Backup failed. | Minor | The backup failed. One of the following could be the cause of the failure:  
- The appliance could not access a backup directory.  
- The backup was interrupted by one of the following signals: SIGINT, SIGHUP, or SIGTERM.  
- Incorrect login or connection failure in an FTP backup.  
- The backup failed to create temporary files. | Review the syslog file to identify the possible cause of this problem. |

### Database Backup Failure

<table>
<thead>
<tr>
<th>Failure Description</th>
<th>Sev.</th>
<th>Cause</th>
<th>Solution</th>
</tr>
</thead>
<tbody>
<tr>
<td>Database backup failed.</td>
<td>Not implemented</td>
<td>The db_dump process failed.</td>
<td>Review the syslog file to identify the possible cause of this problem.</td>
</tr>
</tbody>
</table>

### Backup Module Failure

<table>
<thead>
<tr>
<th>Failure Description</th>
<th>Sev.</th>
<th>Cause</th>
<th>Solution</th>
</tr>
</thead>
</table>

### Backup File Size Exceeded
<table>
<thead>
<tr>
<th>Event</th>
<th>Level</th>
<th>Description</th>
<th>Recommendation</th>
</tr>
</thead>
<tbody>
<tr>
<td>File size exceeded the quota. Backup failed</td>
<td>Not</td>
<td>The backup failed because the file size exceeded the limit of 5GB.</td>
<td>Limit the size of the backup file to less than 5GB.</td>
</tr>
<tr>
<td>Another backup is in progress. Backup will not be performed.</td>
<td>Not</td>
<td>The backup failed because of an attempt to back up or merge files while another backup or restore was in progress.</td>
<td>Wait until the backup or restore is complete before starting another backup.</td>
</tr>
<tr>
<td><strong>Watchdog Process Monitoring</strong></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>WATCHDOG: &lt;registered client name&gt; failed on &lt;server IP address&gt;</td>
<td>Critical</td>
<td>The watchdog process detected a registered client failure on a specific server. The &lt;registered client name&gt; could be one of the following: • Clusterd_timeout • DB_Sentinel • Process_Manager • Clusterd_monitor • Disk_monitor</td>
<td>Review the syslog file to identify the possible cause of this problem.</td>
</tr>
<tr>
<td><strong>Microsoft Server</strong></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Microsoft server &lt;hostname&gt;/&lt;IP address&gt; has failed.</td>

- The appliance ran out of memory. The appliance encountered this problem when one of the following occurred:
  - The total free memory on the appliance was less than or equal to 0%.
  - The total physical memory was less than the total free memory.
  - The percentage of free memory compared to the total physical memory was less than 5%, and the free swap percentage was less than 80%.
  - The percentage of free memory compared to the total physical memory was less than 5%, plus the numbers of both swap INs and swap OUTs were greater than or equal to 3,200.
  - The percentage of free memory compared to the total physical memory was between 5% and 10%, the free swap percentage was greater than or equal to 80%, plus the numbers of both swap INs and swap OUTs were greater than or equal to 3,200.
  - The percentage of free memory compared to the total physical memory was greater than 10%, the free swap percentage was less than 80%, plus the numbers of both swap INs and swap OUTs were greater than or equal to 3,200.

Note: Free memory = free physical RAM + free cache buffers. The high threshold for swap pages is 3,200.

</tr>
</tbody>
</table>

### IPMI Device state change

<table>
<thead>
<tr>
<th>Status</th>
<th>Level</th>
<th>Description</th>
<th>Action(s)</th>
</tr>
</thead>
<tbody>
<tr>
<td>IPMI is used by some hardware monitors to test hardware health. The IPMI Device has not responded. Hardware monitors may show spurious failures.</td>
<td>Informational</td>
<td>The IPMI Device has not responded.</td>
<td>• Check if an admin disabled the IPMI interface.</td>
</tr>
<tr>
<td>IPMI Device failed.</td>
<td>Major</td>
<td>The IPMI Device has failed.</td>
<td>• Review the audit log file.</td>
</tr>
</tbody>
</table>
IPMI is used by some hardware monitors to test hardware health. Because the IPMI Device has not responded for a while, hardware monitor failures are likely to be spurious.

Informational  The IPMI Device has not responded.

- Check if an admin disabled the IPMI interface.
- Review the audit log file.

IPMI is used by some hardware monitors to test hardware health. The IPMI Device is now available; subsequent hardware monitor failures are likely to be genuine.

Informational  The IPMI Device is now available  No action required.

**ibPlatformOne MIB**

The `ibPlatformOne MIB` provides information about the CPU temperature of the appliance, the replication status, the average latency of DNS requests, DNS security alerts, CPU and memory utilization of the appliance, and the Infoblox service status. Figure 39.4 illustrates the structure of the PlatformOne MIB. (Note that the OIDs in the illustration do not include the prefix .1.3.6.1.4.1.7779.)

The `ibPlatformOne MIB` contains the following objects:

- `ibCPUTemperature` (IbString) tracks the CPU temperature of the appliance.
- `ibClusterReplicationStatusTable` provides information in tabular format about the replication status of the appliance. For information, see `ibClusterReplicationStatusTable`.
- `ibNetworkMonitor` provides information about the average latency of authoritative and nonauthoritative replies to DNS queries for different time intervals. It also provides information about invalid DNS responses that arrive on invalid ports or have invalid DNS transaction IDs. For information, see `ibNetworkMonitor`.
- `ibHardwareType` (IbString) provides information about the hardware platform. For an Infoblox appliance, it provides the model number of the Infoblox hardware platform. For vNIOS appliances, it identifies whether the hardware platform is Riverbed or VMware.
- `ibHardwareId` (IbString) provides the hardware ID of the NIOS appliance.
- `ibSerialNumber` (IbString) provides the serial number of the Infoblox hardware platform.
- `ibNiosVersion` (IbString) provides the version of the NIOS software.
- `ibSystemMonitor` provides information about the CPU and memory utilization of the appliance. For information, see `ibSystemMonitor`.
- `ibGridStatus` provides information about an appliance. It indicates whether the appliance is a Grid Master, member, or an independent appliance.
- `ibHAStatus` provides information about the HA status of a member. It indicates if the member is part of an HA configuration, and if it is the active or passive node.
- `ibGridMasterCandStatus` indicates if a member is a Grid Master candidate.
- `ibGridMasterVIP` provides the Grid Master virtual IP address.
- `ibGridReplicationState` provides information about the replication status.

The `ibPlatformOne MIB` also contains the following tables that provide status of the Infoblox services as well as system and hardware services on the appliance you query:
• ibMemberServiceStatusTable provides status of the Infoblox services, such as the DNS and DHCP services, on a queried appliance. For information, see `ibMemberServiceStatusTable`.

• ibMemberNodeServiceStatusTable provides status of the system and hardware services on a queried appliance. For information, see `ibMemberNodeServiceStatusTable`.

• ibMemberPassiveNodeServiceStatusTable provides status of the system and hardware services on the passive node of an HA pair if the queried appliance is the VIP or the active node of an HA pair. For independent appliances and the passive nodes of HA pairs, this table does not display any status. For information, see `ibMemberPassiveNodeServiceStatusTable`.

Figure 39.4 ibPlatformOne MIB Structure
ibClusterReplicationStatusTable

ibClusterReplicationStatusTable (object ID 3.1.1.2.1.2.1.1) provides information about the Grid replication status. For information about Infoblox
SNMP traps, see ibTrapDesc (OID 3.1.1.1.2.11.0).

Figure 39.5 shows the sub branches of ibClusterReplicationStatusTable.

Figure 39.5 ibClusterReplicationStatusTable Objects

Table 39.9 provides information about the ibClusterReplicationStatusTable objects.

Table 39.9 ibClusterReplicationStatusTable Objects

<table>
<thead>
<tr>
<th>Object (Type)</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ibClusterReplicationStatusEntry</td>
<td>A conceptual row that provides information about the Grid replication status. The status indicates whether the appliance is sending replication queues, receiving queues, or having problems with the replication.</td>
</tr>
<tr>
<td>ibNodeIPAddress (IbIpAddr)</td>
<td>IP address of a Grid member.</td>
</tr>
<tr>
<td>ibNodeReplicationStatus (IbString)</td>
<td>Replication status of the Grid member. The replication status can be one of the following: online, offline, or snapshotting.</td>
</tr>
<tr>
<td>ibNodeQueueFromMaster (Integer)</td>
<td>“Sent” queue size from master.</td>
</tr>
<tr>
<td>ibNodeLastRepTimeFromMaster (IbString)</td>
<td>Last sent time from master.</td>
</tr>
<tr>
<td>ibNodeQueueToMaster (Integer)</td>
<td>“Receive” queue size from master.</td>
</tr>

<td>ibNodeLastRepTimeToMaster (IbString)</td>
<td>Last receive time from master.</td>
</tr>
</tbody>
</table>

ibNetwork Monitor

As shown in Figure 39.6, the ibNetwork Monitor has one subtree, ibNetworkMonitorDNS, that branches out into the following:

- ibNetworkMonitorDNSActive (Integer) reports on whether DNS latency monitoring is enabled. You can enable DNS latency monitoring using the CLI command set monitor dns. For more information, see Enabling and Disabling DNS Alert Monitoring. This is the only object in this branch. When you send a query for this object, the appliance responds with either “active” (1) or “nonactive” (0).
- ibNetworkMonitorDNSNonAA provides information about the average latency of nonauthoritative replies to DNS queries for 1-, 5-, 15-, and 60-minute intervals. For information, see ibNetworkMonitorDNSNonAA Objects.
- ibNetworkMonitorDNSAA provides information about the average latency of authoritative replies to DNS queries for 1-, 5-, 15-, and 60-minute intervals. For information, see ibNetworkMonitorDNSAA Objects.
ibNetworkMonitorDNSSecurity provides information about the invalid DNS responses that arrive on invalid ports or have invalid DNS transaction IDs. ibNetworkMonitorDNSSecurity branches out into the following:

- ibNetworkMonitorDNSSecurityInvalidPort
- ibNetworkMonitorDNSSecurityInvalidTxid
- ibNetworkMonitorDNSSecurityInvalidPortOnly (Counter)
- ibNetworkMonitorDNSSecurityInvalidPortCount (Counter)
- ibNetworkMonitorDNSSecurityInvalidTxidOnly (Counter)
- ibNetworkMonitorDNSSecurityInvalidTxidCount (Counter)
- ibNetworkMonitorDNSSecurityInvalidTxidAndPort (Counter)

For information, see Table 39.12.

**ibSystemMonitor**

As shown in **Figure 39.4**, ibSystemMonitor (object ID 3.1.1.2.1.2.8) has the following subtrees:

- **ibSystemMonitorCpu**: Contains ibSystemMonitorCpuUsage (Integer) that reports the CPU usage of the appliance.
- **ibSystemMonitorMem**: Contains ibSystemMonitorMemUsage (Integer) that reports the memory usage of the appliance.

**Figure 39.8 ibSystemMonitor Objects**
ibMemberServiceStatusTable

As shown in Figure 39.9, ibMemberServiceStatusTable (object ID 3.1.1.2.1.2.9) has one subtree, ibMemberServiceStatusEntry, which contains the following objects:

- `ibServiceName` (String) reports the names of the Infoblox services. For a list of Infoblox services, see Infoblox Services for ibMemberServiceStatusTable.
- `ibServiceStatus` (Integer) reports the status of the Infoblox services. For a list of service status, see Service Status.
- `ibServiceDesc` (String) describes the details of the status.

ibMemberServiceStatusTable displays the current status of the Infoblox services on the appliance that you query. For an HA pair, this table displays the service status of the active node. If the appliance you query is the passive node of an HA pair, this table reflects the service status of the passive node, which can be "inactive" or "unknown."

You can also query ibMemberNodeServiceStatusTable and ibMemberPassiveNodeServiceStatusTable that display system and hardware status on the queried appliance. For information, see ibMemberNodeServiceStatusTable and ibMemberPassiveNodeServiceStatusTable.

</table>
Service Status

When you query the service status on an appliance, the response includes the status of the services. Table 39.16 shows the values and descriptions of the status. Note that for internal Grid operations, the NTP service is always in the “working” state even if it has been disabled through the Infoblox GUI.

Table 39.16 ibServiceStates Values

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>working</td>
<td>The service is functioning properly.</td>

<td>warning</td>
<td>The service is having some issues. Check the service or hardware function and the syslog to identify the problem.</td>
</tr>
<tr>
<td>3</td>
<td>failed</td>
<td>The service failed. Review the syslog to identify the problem.</td>
</tr>
<tr>
<td>4</td>
<td>inactive</td>
<td>The service is disabled or out of service.</td>
</tr>
<tr>
<td>5</td>
<td>unknown</td>
<td>The appliance cannot detect the current status of the service.</td>
</tr>
</tbody>
</table>

ibMemberNodeServiceStatusTable

As shown in Figure 39.10, ibMemberNodeServiceStatusTable (object ID 3.1.1.2.1.10) has one subtree, ibMemberNodeServiceStatusEntry, which contains the following objects:

- `ibMemberNodeServiceName` (String) reports the names of the system and hardware services. For a list of service names, see Infoblox Services for ibMemberServiceStatusTable.
- `ibMemberNodeServiceStatus` (Integer) reports the status of the services. For a list of service status, see Service Status.
- `ibMemberNodeServiceDesc` (String) describes the details of the status.

ibMemberNodeServiceStatusTable displays the current status of the system and hardware services on the appliance that you query. For example, when you query an independent appliance, this table shows the information about the independent appliance. When you query the VIP of an HA pair, this table shows the information about the active node. For the active node of the HA pair, you can also query `ibMemberPassiveNodeServiceStatusTable` to get the status of the passive node. For information, see ibMemberPassiveNodeServiceStatusTable.

Note: For an independent appliance and the passive node of an HA pair, no information is returned when you query `ibMemberPassiveNodeServiceStatusTable`. 
Figure 39.10 ibMemberNodeServiceStatusTable Objects

As shown in Figure 39.10, ibMemberNodeServiceStatusTable (object ID 3.1.1.2.1.10.1) has one subtree, ibMemberNodeServiceStatusEntry, which contains the following objects:

- ibMemberNodeServiceName (String) reports the names of the system and hardware services. For a list of service names, see Infoblox Services for ibMemberServiceStatusTable.
- ibMemberNodeServiceStatus (Integer) reports the status of the services. For a list of possible service status, see Service Status.
- ibMemberNodeServiceDesc (String) describes details of the status.

ibMemberPassiveNodeServiceStatusTable displays the current status of the system and hardware services on the passive node of an HA pair when you query the VIP of the HA pair. For independent appliances and the passive nodes of HA pairs, this table does not display any status. Figure 39.11 ibMemberPassiveNodeServiceStatusTable Objects

ibDHCPOne MIB

The ibDHCPOne MIB provides information about address usage within a subnet, DHCP lease statistics, and DHCP packet counts. It includes two
modules, ibDHCPModule for IPv4 data and ibDHCPv6Module for IPv6 data.

**ibDHCPModule**

*Figure 39.12* illustrates the structure of the ibDHCPModule. (Note that the OIDs shown in the illustration do not include the prefix .1.3.6.1.4.1.7779.) *ibDHCPModule* contains the following objects:

- **ibDHCPSubnetTable** provides statistical data about the DHCP operations of the appliance. For information, see *ibDHCPSubnetTable*.
- **ibDHCPStatistics** maintains counters for different types of packets. For information, see *ibDHCPStatistics*.
- **ibDHCPDeferredQueuesize** tracks the total number of deferred DDNS updates that are currently in the queue to be retried. When DDNS updates are deferred due to timeout or server issues, the DHCP server puts these updates in this queue.
- **ibDHCPDDNSStats** monitors the average latency for the DDNS updates in microseconds and the number of timeouts during different time intervals. For information, see *ibDHCPDDNSStats*.

*Figure 39.12 ibDHCPModule*

**ibDHCPSubnetTable**

*ibDHCPSubnetTable* provides statistical data about the DHCP operations of the appliance. It contains the following objects:

*Table 39.17 ibDHCPSubnetTable*

<table>
<thead>
<tr>
<th>Object (Type)</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ibDHCPSubnet Entry</td>
<td>File that contains the objects for monitoring DHCP operations on the appliance.</td>
</tr>
</tbody>
</table>
ibDHCPSubnetNetworkAddress (IbIpAddr)
The subnetworks, in IP address format, that have IP addresses for lease. A subnetwork may have many address ranges for lease.

ibDHCPSubnetNetworkMask (IbIpAddr)
The subnet mask in dotted decimal format.

ibDHCPSubnetPercentUsed (Integer)
The percentage of dynamic DHCP addresses leased out at this time for each subnet. Fixed addresses are always counted as leased for this calculation, if the fixed addresses are within a leased address range.

Following is an example of the table as viewed through a MIB browser:

<table>
<thead>
<tr>
<th>ibDHCPSubnetNetworkAddress</th>
<th>ibDHCPSubnetNetworkMask</th>
<th>ibDHCPSubnetPercentUsed</th>
</tr>
</thead>
<tbody>
<tr>
<td>1 10.0.0.0</td>
<td>255.0.0.0</td>
<td>0.0000</td>
</tr>
<tr>
<td>2 20.0.0.0</td>
<td>255.255.255.0</td>
<td>0.0000</td>
</tr>
<tr>
<td>3 20.0.0.00</td>
<td>255.255.255.0</td>
<td>0.0000</td>
</tr>
<tr>
<td>4 20.0.0.00</td>
<td>255.255.255.0</td>
<td>0.0000</td>
</tr>
<tr>
<td>5 20.0.0.00</td>
<td>255.255.255.0</td>
<td>0.0000</td>
</tr>
<tr>
<td>6 20.0.0.00</td>
<td>255.255.255.0</td>
<td>0.0000</td>
</tr>
<tr>
<td>7 20.0.0.00</td>
<td>255.255.255.0</td>
<td>0.0000</td>
</tr>
<tr>
<td>8 20.0.0.00</td>
<td>255.255.255.0</td>
<td>0.0000</td>
</tr>
<tr>
<td>9 20.0.0.00</td>
<td>255.255.255.0</td>
<td>0.0000</td>
</tr>
<tr>
<td>10 20.0.0.00</td>
<td>255.255.255.0</td>
<td>0.0000</td>
</tr>
</tbody>
</table>

**ibDHCPStatistics**

ibDHCPStatistics maintains counters for different types of packets. The counters always start with zero when the DHCP service is restarted. Therefore, the numbers reflect the total number of packets received since the DHCP service was last restarted on the appliance. The ibDHCPStatistics module contains the following objects:

**Table 39.18 ibDHCPStatistics**

<table>
<thead>
<tr>
<th>Object (Type)</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ibDhcpTotalNoOfDiscovers (Counter)</td>
<td>The number of DHCPDISCOVER messages that the appliance received. Clients broadcast DHCPDISCOVER messages when they need an IP address and network configuration information.</td>
</tr>
<tr>
<td>ibDhcpTotalNoOfRequests (Counter)</td>
<td>The number of DHCPREQUEST messages that the appliance received. A client sends a DHCPREQUEST message requesting configuration information, after it receives the DHCPOFFER message.</td>
</tr>
<tr>
<td>ibDhcpTotalNoOfReleases (Counter)</td>
<td>The number of DHCPRELEASE messages that the appliance received from its clients. A client sends a DHCP release when it terminates its lease on an IP address.</td>
</tr>
<tr>
<td>ibDhcpTotalNoOfOffers (Counter)</td>
<td>The number of DHCPOFFER messages that the appliance has sent to clients. The appliance sends a DHCPOFFER message to a client. It contains an IP address and configuration information.</td>
</tr>
<tr>
<td>ibDhcpTotalNoOfAcks (Counter)</td>
<td>The number of DHCPACK messages that the appliance sent to clients. It sends a DHCPACK message to a client to confirm that the IP address offered is still available.</td>
</tr>
<tr>
<td>ibDhcpTotalNoOfNacks (Counter)</td>
<td>The number of DHCPNACK messages that the appliance sent to clients. It sends a DHCPNACK message to withdraw its offer of an IP address.</td>
</tr>
<tr>
<td>ibDhcpTotalNoOfDeclines (Counter)</td>
<td>The number of DHCPDECLINE messages that the appliance received. A client sends a DHCPDECLINE message if it determines that an offered IP address is already in use.</td>
</tr>
<tr>
<td>ibDhcpTotalNoOfInforms (Counter)</td>
<td>The number of DHCPINFORM messages that the appliance received. A client sends a DHCPINFORM message when it has an IP address but needs information about the network.</td>
</tr>
<tr>
<td>ibDhcpTotalNoOfOthers (Counter)</td>
<td>The total number of DHCP messages other than those used in negotiation, such as DHCPOFFER/RENEW, DHCPKNOWN, and DHCPLEASEQUERY.</td>
</tr>
</tbody>
</table>
ibDHCPDDNSStats

ibDHCPDDNSStats monitors the average latency for the DHCP DDNS updates in microseconds and the number of timeouts during different time intervals. The ibDHCPDDNSStats module contains the following objects:

**Table 39.19 ibDHCPStatistics**

<table>
<thead>
<tr>
<th>Object (Type)</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ibDHCPDDNSAvgLatency5 (Integer)</td>
<td>Indicates the average latency in microseconds of the DHCP DDNS updates in the last five minutes.</td>
</tr>
<tr>
<td>ibDHCPDDNSAvgLatency15 (Integer)</td>
<td>Indicates the average latency in microseconds of the DHCP DDNS updates in the last 15 minutes.</td>
</tr>
<tr>
<td>ibDHCPDDNSAvgLatency60 (Integer)</td>
<td>Indicates the average latency in microseconds of the DHCP DDNS updates in the last 60 minutes.</td>
</tr>
<tr>
<td>ibDHCPDDNSAvgLatency1440 (Integer)</td>
<td>Indicates the average latency in microseconds of the DHCP DDNS updates in the last 24 hours.</td>
</tr>
<tr>
<td>ibDHCPDDNSTimeoutCount5 (Integer)</td>
<td>The number of timeouts for the DHCP DDNS updates in the last five minutes.</td>
</tr>
<tr>

<td>The number of timeouts for the DHCP DDNS updates in the last 60 minutes.</td>
</tr>
<tr>
<td>ibDHCPDDNSTimeoutCount1440 (Integer)</td>
<td>The number of timeouts for the DHCP DDNS updates in the last 24 hours.</td>
</tr>
</tbody>
</table>

ibDHCPv6Module

Figure 39.14 illustrates the structure of the ibDHCPv6Module, which contains the following objects:

- ibDHCPv6SubnetTable provides statistical data about the DHCPv6 operations of the appliance. For information, see ibDHCPv6SubnetTable.
- ibDHCPv6Statistics maintains counters for different types of packets. For information, see ibDHCPv6Statistics.
- ibDHCPv6DeferredQueueSize tracks the total number of deferred DDNS updates that are currently in the queue to be retried. When DDNS updates are deferred due to timeout or server issues, the DHCP server puts these updates in this queue.
- ibDHCPv6DDNSStats monitors the average latency for the DDNS updates in microseconds and the number of timeouts during different time intervals. For information, see ibDHCPv6DDNSStats.

Figure 39.14 ibDHCPv6Module
ibDHCPv6SubnetTable

ibDHCPv6SubnetTable provides statistical data about the DHCPv6 operations of the appliance. It contains the following objects:

Table 39.20 ibDHCPv6SubnetTable

<table>
<thead>
<tr>
<th>Object (Type)</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ibDHCPv6Subnet Entry</td>
<td>File that contains the objects for monitoring DHCPv6 operations on the appliance.</td>

<td>The subnetworks, in IPv6 address format, that have IPv6 addresses for lease. A subnetwork may have many address ranges for lease.</td>
</tr>
<tr>
<td>ibDHCPv6SubnetNetworkMask (IbIpAddr)</td>
<td>The subnet mask in CIDR notation format.</td>
</tr>
</tbody>
</table>

ibDHCPv6Statistics

ibDHCPv6Statistics maintains counters for different types of packets. The counters always start with zero when the DHCP service is restarted. Therefore, the numbers reflect the total number of packets received since the DHCP service was last restarted on the appliance. The ibDHCPv6Statistics module contains the following objects:

Table 39.21 ibDHCPv6Statistics

<table>
<thead>
<tr>
<th>Object (Type)</th>
<th>Description</th>
</tr>
</thead>
</table>

ibDhcpv6TotalNoOfSolicits (Counter)  The number of Solicit messages that the Grid member received, including Solicit messages embedded in Relay-Forward messages. A DHCP client sends a Solicit message to locate DHCP servers.

ibDhcpv6TotalNoOfRequests (Counter) The number of Request messages that the Grid member received. A DHCP client sends a Request message to request one or more IP addresses and configuration parameters from a DHCP server.

ibDhcpv6TotalNoOfReleases (Counter) The number of Release messages that the Grid member received. A DHCP client sends a Release message when it terminates its lease and releases its IP address.

ibDhcpv6TotalNoOfAdvertises (Counter) The number of Advertise messages that the Grid member sent. When a DHCP server receives a Solicit message, it can respond with an Advertise message to indicate that the server is available for DHCP service.

ibDhcpv6TotalNoOfReplies (Counter) The number of Reply messages that the Grid member sent. A DHCP server sends a Reply message that includes IP addresses and configuration parameters when it responds to Solicit, Request, Renew or Rebind message. It sends a Reply message with configuration parameters only when it responds to an Information-Request message.

ibDhcpv6TotalNoOfRenews (Counter) The number of Renew messages that the Grid member received. A DHCP client sends a Renew message to a DHCP server to extend the lifetimes on the leases granted by the DHCP server and to update other properties.

ibDhcpv6TotalNoOfRebinds (Counter) The number of Rebind messages that the Grid member received. A DHCP client sends a Rebind message to extend the lifetime of its lease and to update configuration parameters.

ibDhcpv6TotalNoOfDeclines (Counter) The number of Decline messages that the Grid member received. A DHCP client sends a Decline message to the DHCP server when it discovers that the IP address offered by a DHCP server is already in use.

ibDhcpv6TotalNoOfInformationRequests (Counter) The number of Information-Request messages that the Grid member received. A client sends an Information-Request message to retrieve configuration parameters, such as the IP addresses of DNS servers in the network.

ibDhcpv6TotalNoOfOthers (Counter) The total number of DHCP messages other than those used in negotiation.

ibDhcpv6DDNSStats

ibDhcpv6DDNSStats monitors the average latency for the DHCPv6 DDNS updates in microseconds and the number of timeouts during different time intervals. The ibDhcpv6DDNSStats module contains the following objects:

<table>
<thead>
<tr>
<th>Object (Type)</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ibDhcpv6DDNSAvgLatency5 (Integer)</td>
<td>Indicates the average latency in microseconds of the DHCPv6 DDNS updates in the last five minutes.</td>
</tr>
<tr>
<td>ibDhcpv6DDNSAvgLatency15 (Integer)</td>
<td>Indicates the average latency in microseconds of the DHCPv6 DDNS updates in the last 15 minutes.</td>
</tr>
<tr>
<td>ibDhcpv6DDNSAvgLatency60 (Integer)</td>
<td>Indicates the average latency in microseconds of the DHCPv6 DDNS updates in the last 60 minutes.</td>
</tr>
<tr>
<td>ibDhcpv6DDNSAvgLatency1440 (Integer)</td>
<td>Indicates the average latency in microseconds of the DHCPv6 DDNS updates in the last 24 hours.</td>
</tr>
<tr>
<td>ibDhcpv6DDNSTimeoutCount5 (Integer)</td>
<td>The number of timeouts for the DHCPv6 DDNS updates in the last five minutes.</td>
</tr>
<tr>
<td>ibDhcpv6DDNSTimeoutCount15 (Integer)</td>
<td>The number of timeouts for the DHCPv6 DDNS updates in the last 15 minutes.</td>
</tr>
<tr>
<td>ibDhcpv6DDNSTimeoutCount60 (Integer)</td>
<td>The number of timeouts for the DHCPv6 DDNS updates in the last 60 minutes.</td>
</tr>
<tr>
<td>ibDhcpv6DDNSTimeoutCount1440 (Integer)</td>
<td>The number of timeouts for the DHCPv6 DDNS updates in the last 24 hours.</td>
</tr>
</tbody>
</table>

ibDNSOne MIB

The ibDNSOne MIB provides DNS statistics about all zones in all views. Figure 39.15 illustrates the structure of the ibDNSOne MIB. (Note that the
Using the DNS Zone Statistics Tables

ibZoneStatisticsTable and ibZonePlusViewStatisticsTable provide DNS statistics for all zones in all DNS views, including the default and all user-defined DNS views. You can use the information in these tables to calculate the total number of recursive queries on the DNS server. Depending on whether your DNS server is an authoritative or a caching-only server, you calculate the total number of recursive queries differently. For information, see Calculating Recursive DNS Queries.

ibZoneStatisticsTable

ibZoneStatisticsTable contains DNS statistics of all zones in the default DNS view. DNS statistics of user-defined DNS views are captured in ibZonePlusViewStatisticsTable. For information, see ibZonePlusViewStatisticsTable.

ibZoneStatisticsTable includes a "summary" zone that provides global statistics for the DNS server, including statistics for all zones in the default and user-defined DNS views.

The syntax of the objects in ibZoneStatisticsTable uses a Counter64 format. In some cases, the counter format may not be compatible with SNMP toolkits that use a 32-bit counter. Ensure that you reconfigure or update these tools to use the Counter64 format. ibZoneStatisticsTable contains the following objects:

Table 39.23 ibZoneStatisticsTable

<table>
<thead>
<tr>
<th>Object (Type)</th>
<th>Description</th>
</tr>
</thead>
</table>

</tr>
<tr>
<td>ibBindZonePlusViewReferral (Counter64)</td>
<td>The number of DNS referrals since the DNS process started.</td>
</tr>
<tr>
<td>ibBindZonePlusViewNxRRset (Counter64)</td>
<td>The number of DNS queries received for non-existent records.</td>
</tr>
<tr>
<td>ibBindZonePlusViewNxDomain (Counter64)</td>
<td>The number of DNS queries received for non-existent domains.</td>
</tr>
<tr>
<td>ibBindZonePlusViewRecursion (Counter64)</td>
<td>The number of queries that caused recursion since the DNS process started.</td>
</tr>
</tbody>
</table>

Following is an example of the table as viewed through a MIB browser:

![MIB Browser View](image)

ibZonePlusViewStatisticsTable

ibZonePlusViewStatisticsTable provides DNS statistics about all zones in user-defined DNS views. DNS statistics about zones in the default view are captured in ibZoneStatisticsTable. Note that information in ibZonePlusViewStatisticsTable is rolled up to the "summary" zone in ibZoneStatisticsTable. For information, see ibZoneStatisticsTable.

The syntax of the objects in ibZonePlusViewStatisticsTable uses a Counter64 format. In some cases, the counter format may not be compatible with SNMP toolkits that use a 32-bit counter. Ensure that you reconfigure or update these tools to use the Counter64 format.

ibZonePlusViewStatisticsTable contains the following objects:

<table>
<thead>
<tr>
<th>Table 39.24 ibZonePlusViewStatistics Table</th>
</tr>
</thead>
<tbody>
<tr>
<td>Object (Type)</td>
</tr>
<tr>
<td>ibBindZonePlusViewName (IbString)</td>
</tr>
<tr>
<td>ibBindZonePlusViewSuccess (Counter64)</td>
</tr>
<tr>
<td>ibBindZonePlusViewReferral (Counter64)</td>
</tr>
<tr>
<td>ibBindZonePlusViewNxRRset (Counter64)</td>
</tr>
<tr>
<td>ibBindZonePlusViewNxDomain (Counter64)</td>
</tr>
<tr>
<td>ibBindZonePlusViewRecursion (Counter64)</td>
</tr>
</tbody>
</table>
Calculating Recursive DNS Queries

You can use the information in `ibZoneStatisticsTable` and `ibZonePlusViewStatisticsTable` to calculate the total number of recursive queries. Following is an example of `ibZoneStatisticsTable` indexed by zone names in the default view:

```
index  ibBindZoneName  ibBindZoneSuccess  ibBindZoneReferral  ibBindZoneNxRRset  ibBindZoneNxDomain  ibBindZoneRecursion  ibBindZoneFailure
"abc.com"   abc.com       0          0                  0                  0                  0
"summary"    summary      500        0                  0                  0                  0
"internal.com" internal.com  100        0                  0                  0
```

Following is an example of `ibZonePlusViewStatisticsTable` indexed by zone names in all user-defined views:

```
index  ibBindZonePlusViewName  ibBindZonePlusViewSuccess  ibBindZonePlusViewReferral  ibBindZonePlusViewNxRRset  ibBindZonePlusViewNxDomain  ibBindZonePlusViewRecursion  ibBindZonePlusViewFailure  ibBindViewName
"ext1.com"     ext1.com       100              0                  0                  0                  DNS1
"ext2.com"     ext2.com       200              0                  0                  0                  DNS1
"ext3.com"     ext3.com       0                0                  0                  0                  DNS2
```

Use the `ibBindZoneSuccess` object in both tables to determine the total number of recursive queries. If your DNS server is a caching-only server, the total number of recursive queries is the number indicated in the `ibBindZoneSuccess` object of the "summary" zone. In this example, for a caching-only server, the total number of recursive queries is 5.

If your DNS server is an authoritative server, add all the numbers in `ibBindZoneSuccess` for all zones in both tables, excluding the "summary" zone. In this example, the total is 4. You then subtract this number from the number in `ibBindZoneSuccess` of the "summary" zone. In this case, the total number of recursive queries is 1 for an authoritative DNS server.

`ibDDNSUpdateStatistics`

`ibDDNSUpdateStatistics` provides statistical data about DDNS updates. The counters always start with zero when the DNS service is restarted. They report the total numbers since the DNS service was last restarted.

`ibDDNSUpdateStatistics` contains the following objects:

<table>
<thead>
<tr>
<th>Object (Type)</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>ibDDNSUpdateSuccess</code> (Counter64)</td>
<td>The number of successful dynamic DNS updates.</td>
</tr>
<tr>
<td><code>ibDDNSUpdateFailure</code> (Counter64)</td>
<td>The number of all failed dynamic DNS updates, excluding those reported by the <code>ibDDNSUpdateReject</code> object.</td>
</tr>
<tr>
<td><code>ibDDNSUpdateReject</code> (Counter64)</td>
<td>The number of dynamic DNS updates that failed because they were denied by the DNS server.</td>
</tr>
<tr>
<td><code>ibDDNSUpdatePrerequisiteReject</code> (Counter64)</td>
<td>The number of dynamic DNS updates that failed because the prerequisites were not satisfied. This is also included in the total number of failures reported by the <code>ibDDNSUpdateFailure</code> object.</td>
</tr>
</tbody>
</table>
ibBindZoneTransferCount (Counter64) provides the total number of successful zone transfers from an Infoblox primary or secondary DNS server to a DNS client, since the DNS service was last restarted. Note that this counter tracks the number of successful full zone transfers (AXFRs) and incremental zone transfers (IXFRs).

**IB-DNSSERV-MIB**

The IB-DNSSERV-MIB contains one object, ibDnsServConfig, which reports the DNS BIND version implemented by the NIOS software.

**IB-DNSHITRATIO-MIB**

The IB-DNSHITRATIO-MIB contains one object, ibDnsHitRatio, which provides information about the DNS cache hit ratio. Note that the MIB variable (ibDNSOne) for cache hit rate has an OID of 1.3.6.1.4.1.7779.3.1.3.1.5.0, where 1.3.6.1.4.1.7779 is the prefix.

**IB-DNSQUERYRATE-MIB**

The IB-DNSQUERYRATE-MIB contains one object, ibDnsQueryRate, which provides information about the DNS queries per second. Note that the MIB variable (ibDNSOne) for DNS query rate has an OID of 1.3.6.1.4.1.7779.3.1.3.1.6.0, where 1.3.6.1.4.1.7779 is the prefix.

**IB-DHCPSERV-MIB**

The IB-DHCPSERV-MIB contains one object, ibDhcpv4ServerSystemDescr, which provides the DHCP server name and its DHCP version.

**Chapter 40 Infoblox Reporting and Analytics**

This chapter describes the Infoblox Reporting and Analytics solution and its features. It explains how to navigate through the user interface, view predefined dashboards, create personal reports and searches. It also provides best practices for customizing searches and setting permissions, and describes the reporting clustering feature and how to configure a reporting cluster.

It contains the following sections:

- Infoblox Reporting and Analytics
  - Upgrading from a Previous NIOS Release
  - Setting Up Reporting and Analytics
  - Supported Reporting Appliances and Storage Space
- Licensing Requirements
  - Perpetual Licensing
  - Subscription Licensing
  - About License Violations
- Administrative Permissions
  - Granting Permissions
  - Editing Permissions
- Configuring an External Server for Search Result Exports
- About Reporting Clustering
  - Clustering Overview
  - Reporting Cluster Modes
  - Clustering Data Replication
  - ReportingSite Extensible Attribute
  - Monitoring Reporting Cluster Status
  - Promoting the Grid Master Candidate in Multi-Site Clustering
  - Reporting Categories and Related Data Sources
  - Configuring Reporting Clusters
  - Assigning a ReportingSite EA Value to a Multi-Site Cluster
  - Validating Reporting Clustering Configuration
- Guidelines for Deploying Reporting Clusters
  - Best Practices for Capacity Planning
  - Monitor Volume and Storage Consumption
  - Deployment and Service Monitoring
  - Other Best Practices for Deploying Reporting Clusters
- Grid Reporting Properties
  - Configuring Grid Reporting Properties
  - Reporting (Index) Storage Space
  - Modifying Member Reporting Properties
  - Defining Interface for Reporting Traffic
  - Setting the Network Port for Reporting
  - Specifying the Data Generation Interval for Reports
  - Configuring Threat Protection Data
  - Monitoring DNS Client Queries

Infoblox Reporting and Analytics

The Infoblox Reporting and Analytics solution automates the collection, analysis, and presentation of core network service data that assists you in planning and mitigating network outage risks so you can manage your networks more efficiently. It provides predefined dashboards and reports that capture useful information about the activities and performance of core network services. It also provides an enhanced reporting interface so you can create custom dashboards, reports, and alerts.

NOTE: For Reporting and Analytics to function properly, ensure that you DO NOT create a SHA-256 4096 SSL key for the HTTPS certificate in your Grid because Java does not support SHA-256 with a 4096 key size.

Through reporting clustering, you can combine and configure multiple reporting members in a cluster. These reporting members work together to provide greater performance with higher data throughput and indexing capacity. The cluster also efficiently scales storage and indexing capacity. Reporting data is replicated among these reporting appliances to ensure continuous service even if one of the servers fails. You can configure...
more reporting appliances in multiple locations (sites) so that reporting data and service can be recovered from catastrophic disasters. Thus, the reporting clustering solution increases scale, offers higher reporting performance and greatly improves the reliability of the Reporting and Analytics solution. For information about this feature, see About Reporting Clustering.

When you set up a reporting appliance with valid licenses in the Grid, the reporting server acts as an indexer that collects data from Grid members while the members are forwarders that transmit information to the reporting server. The reporting server indexes all raw data and transforms it into searchable events. Depending on your needs, you can enable certain Grid members as forwarders and disable others so the reporting server receives only the information you need from specific members. Figure 40.1 depicts the high-level configuration of the NIOS Reporting and Analytics solution:

The Infoblox reporting solution supports both IPv4 and IPv6 networks and you can configure a reporting member in IPv4, IPv6, or in dual mode (IPv4 and IPv6) network environment. An IPv4 reporting member uses IPv4 as the communication protocol, so you can add an IPv4 reporting member to an IPv4 or dual mode Grid. An IPv6 reporting member uses IPv6 as the Grid communication protocol, so you can add an IPv6 reporting member to an IPv6 or dual mode Grid. But a dual mode reporting member can use either IPv4 or IPv6 as the communication protocol, so you can add a dual mode reporting member to an IPv4, IPv6, or a dual mode Grid. For more information about how to set up the communication protocol, see Changing the Communication Protocol for a Dual Mode Appliance.

Upgrading from a Previous NIOS Release

When you upgrade from a previous NIOS release to NIOS 7.3.x and later releases, you will notice that some of the reporting features and terminologies have changed. For example, searches and reports in previous NIOS releases are now reports and dashboards respectively in the new reporting solution. In addition, your custom reports might be affected. Infoblox recommends that you take some time to explore the new user interface and get familiar with the terminologies.

You can continue to use the Infoblox predefined reports from previous releases in the new interface and customize them to meet your specific requirements, or you can create new custom reports from the ground up using a powerful search pattern.

Note: Infoblox Reporting and Analytics integrates with Splunk to deliver an enhanced reporting interface so you can create dashboards, reports, and alerts. This chapter attempts to explain all reporting functionality you can perform through the enhanced interface. However, you may need to refer to the Splunk documentation for certain functionality as indicated in specific sections of this chapter. In addition, some functions and capabilities referenced in the Splunk documentation, such as setting up custom Python scripts, are not available or applicable to the Infoblox Reporting and Analytics as some Splunk functionality in the Infoblox product may be limited or modified by Infoblox. Infoblox does not represent or warrant that Infoblox Reporting and Analytics will function in accordance with the Splunk documentation. Infoblox is also not responsible for the accuracy of the Splunk documentation. For Infoblox Reporting and Analytics technical support, contact Infoblox Technical Support. DO NOT contact Splunk.

When you upgrade from a previous NIOS release to NIOS 7.3.x and later, there are some significant changes to the Reporting and Analytics solution. Some of the important changes are as follows:

- **Terminology:** The following table lists the terminology differences when you upgrade:

<table>
<thead>
<tr>
<th>Pre-NIOS 7.3.0 Release</th>
<th>NIOS 7.3.0 and later</th>
</tr>
</thead>
<tbody>
<tr>
<td>Searches</td>
<td>Reports</td>
</tr>
<tr>
<td>Reports</td>
<td>Dashboards</td>
</tr>
</tbody>
</table>

- **Object Management:** NIOS no longer manages reporting objects such as searches, smart folders, alerts, and reports. You will not be able to perform operations such as global search, quick filtering, bookmarking, and others for these objects. You can now manage these objects through the new user interface.
Note: Smart folders are migrated after an upgrade. However, data in the smart folders is not migrated, and all filters for the smart folders are reset to default.

- **Permissions**: Permissions for all reporting objects are migrated to the new Reporting and Analytics solution and managed through the new user interface after an upgrade. You may see the new built-in role. **Everyone**, when configuring Reporting permissions. For best practices, do not alter permissions for this new built-in role. Note that the Reporting Dashboard and Reporting Search global permissions have been removed. If an admin group or admin role was granted these permissions before an upgrade, the permissions will still be displayed after an upgrade. However, they won't take any effect. The Grid Reporting Properties permission is retained. In addition, reporting object permissions for dashboards and searches (including global dashboards and searches) are migrated. These object permissions are retained for applicable migrated users. If permissions were granted to a specific admin group for a dashboard or search before an upgrade, only these admin users and superusers have permissions to access the migrated dashboard and report after an upgrade. If a limited-access user group is created through the new interface after the upgrade, users in this admin group will not be able to access the dashboard and report even if they are granted access to the Infoblox Reporting and Analytics App. Superusers must explicitly grant permissions to this limited-access admin group for users in this group to access the dashboard and report. For more information, see Granting Permissions.

- **Navigation and Visualization**: Navigations for some reporting functions, such as searches, alerts, email and page settings, and email PDF delivery, have changed. You can navigate through the new user interface to get familiar with the changes in this release. In addition, all predefined reports might look different than the traditional ones depending on your filtering configuration. The Grid Reporting Properties editor and Groups tab are moved under the Administration tab –> Reporting tab.

Note: Bookmarked groups are migrated after an upgrade. The bookmarked group navigates to the Administration tab –> Reporting tab –> Groups tab.

- **Extensible Attributes**: The reports that supported filtering and grouping by multiple extensible attributes are migrated to the new interface with filtering and grouping only by the extensible attribute Site. You must clone the dashboard, add filter inputs and modify the view XML to support additional extensible attributes. For information, see Editing the XML Source Code of a Dashboard.

- **Searches and Reports**: Only NIOS system and global reports and searches are migrated to NIOS 7.3.0 and later versions as dashboards and reports respectively. All user private reports and searches are dropped. In addition, bookmarked reports and searches are not migrated to 7.3.x release. If you want to keep any customization for the user private dashboards and reports, do one of the following:
  - Create global dashboards and reports using the same settings.
  - After an upgrade, you can clone the corresponding migrated system or global dashboards and reports, and then reconfigure the original settings, such as filters and scheduling in the new user interface.

- **Custom Search**: You can create your own search pattern and save it as a dashboard or report. For information, see About Searches.

After completing the NIOS upgrade successfully, you configure the Grid Reporting properties and remote server (FTP, SCP, or TFTP) to export search results. For information, see Configuring Grid Reporting Properties and Configuring an External Server for Search Result Exports.

### Setting Up Reporting and Analytics

To enable and start using the Infoblox reporting solution on supported reporting appliances, complete the following:

1. Install a valid Reporting license on the reporting appliance, as described in Licensing Requirements. Note that Infoblox now offer subscription licenses for the reporting solution.
2. Set administrative permissions, as described in Administrative Permissions.
3. Configure reporting properties, as described in Grid Reporting Properties.
4. Start the reporting service on the indexer and forwarders.

### Supported Reporting Appliances and Storage Space

Infoblox provides several reporting appliances to address different reporting requirements. Table 40.3 lists the supported Trinzic Reporting platforms based on IP capacities and average DHCP leases and DNS queries per second. There will be an impact on the performance of your reporting server when you perform many searches, download PDF reports, and send reports through emails and alerts. It is important to consider the reporting server configuration and make sure that it can handle the overall workload. A reporting appliance uses up to 95% of the total reporting disk space. The usable hard disk space on different appliance models is shown in Table 40.2.

**Table 40.2 Infoblox Reporting Appliances and their Usable Reporting Hard Disk Space**

<table>
<thead>

</tbody>
</table>
### Licensing Requirements

You can install a valid Reporting license on a supported Trinzic Reporting platform and configure it as a reporting member solely for reporting purposes. You cannot add licenses to run other services, such as DNS and DHCP, on the reporting member. For information about Infoblox platforms that support reporting, see About Reporting Clustering.

Infoblox offers perpetual and subscription licensing programs to meet your business needs. You must obtain a new replacement license from Infoblox if you want to transfer an existing license to another member.

#### Perpetual Licensing

A perpetual license is appliance-specific, meaning you can install only one perpetual license on each reporting appliance. There is no expiration date for this license type and you can use the Infoblox Reporting service for the lifetime of the appliance. However, you cannot install a perpetual license on an appliance that already has a valid DNS, DHCP, Microsoft Management, Query Redirection, or Multi-Grid Management license installed. You also cannot join a reporting member that has a perpetual license to a Grid that has a subscription license installed. A subscription license is a Grid-wide license and is not appliance-specific. Reporting members that have perpetual licenses can join a Grid that does not have a subscription license. For information about subscription licenses, see Subscription Licensing.

**Note:** All reporting appliances come with a 500 MB trial license. You can use the set temp_license CLI command to install the trial license. Available indexing capacity for a perpetual license: 1, 2, 5, 10 and 20 GB.

If you plan to configure reporting clustering, note that the overall indexing capacity for a reporting cluster increases based on the total licensing capacity for all reporting members. For example, if your Grid has three reporting members with 2 GB licensing capacity each, the overall cluster indexing capacity for the cluster becomes 6 GB. However, the stacking indexing capacity does not apply to trial licenses. In other words, if the three reporting members in your Grid all have trial licenses, the total cluster indexing capacity remains at 500 MB. For information about reporting clustering, see About Reporting Clustering.

Note that you cannot install a perpetual reporting license on a Grid that has unrestricted reporting VMs as Grid members and vice versa.
However, you can install a subscription license on a Grid that has unrestricted reporting VMs as Grid members. Unrestricted reporting VMs are reporting appliances for which you can arbitrarily configure CPU, memory, and disk size. You can arbitrarily configure CPU, memory, and disk size on IB-V5005 appliance.

Subscription Licensing

A subscription license is a Grid-wide license that you install on the Grid Master, and it is not appliance-specific. A subscription license can either be permanent or have an expiration date and Grid Manager (the Infoblox GUI) displays a 90-day and 30-day warning prior to the actual expiration date. The effective start date for a subscription license starts on the day you generate the license. Note that a reporting member that has a perpetual license is not allowed to join the Grid that has a subscription license. In a dynamic license pool, expiration warnings are based upon the expiration dates of the sub pools. When any licenses in a sub pool expire, the total available licenses for a pool drops accordingly. On the other hand, a perpetual static license allocated to an appliance does not expire. The appliance continues to run the feature for the lifetime of that appliance. For more information about Grid-wide licenses, see Managing Grid-wide Licenses.

Note: Available indexing capacity for a subscription license: 1, 2, 5, 10, 20, 50, 100, 200, and 500 GB. Contact your Infoblox representative for pricing and availability information.

About License Violations

License violations occur when the reporting appliance exceeds the maximum allowed daily volume or when the indexed data type is not allowed for the license type. There might be an impact on the reporting service performance if violations occur. License violation is reported in the Reporting tab of Grid Manager. During the license violation period, the reporting server continues to index data but the search function will cease to be operational. This means that the Reporting tab is available with the following warning message displayed: "Reporting Service is unavailable." You can apply a Reset license to remove the violations. Contact Infoblox Technical Support to obtain a Reporting Reset license. Note the following behavior for such violations:

- NIOS continues to index data; however, you will not be able to use the search feature.
- You can use the reporting search when the number of violations in the previous 30 days is within the limit. To obtain valid licenses, contact your Infoblox representative or Infoblox Technical Support.
- If there are five consecutive violations in five consecutive days, then the search feature is disabled for the next 25 days until a Reset license is installed. If necessary, contact Infoblox Technical Support to obtain a Reporting Reset license so you can reset the current license violations.
- When a license violation, summary indexing does not work and reports that use the summary index will not display output. For information about reports that use the summary index, see Summary Indexes.

Administrative Permissions

You must have the appropriate permissions to access, view, edit, and clone searches, dashboards, reports, and alerts that are available in the Reporting tab. NIOS synchronizes all users and admin groups as users and roles on the reporting server. In NIOS, admin groups may have the setting "superusers" enabled or disabled. NIOS groups that have "superusers" enabled will correspond to roles with administrative permissions on the reporting server. This documentation will refer to this role as a superuser role and the associated users as superusers. NIOS groups that do not have "superusers" enabled will not have administrative permissions on the reporting server. This role will be referred to as a non-superuser role and the associated users are limited-access users. The default NIOS admin group "admin-group" will have a superuser role on the reporting server called "infoblox-admin-role." The default NIOS admin named "admin" will have a user name on the reporting server called "infoblox-admin."

Note: When you enable the reporting service, the splunk-reporting-group is created automatically for authentication by the Reporting and Analytics App on the Grid. It is an internal admin group, so you must not add users to this group or rename it.

By default, superusers have full access to the Reporting and Analytics App and limited-access users do not. Superusers can grant permissions to limited-access users so they can access the Reporting and Analytics App. Limited-access users will not have access to the Reporting tab until superusers grant them this access. For information about Splunk roles, refer to the Splunk documentation. Note that the reporting service does not support non-ASCII characters in the names of admin groups and admin users. When you include ASCII characters and space in the admin user name, make sure that its length does not exceed 33 characters.

When configuring NIOS, only superuser and users with the Grid Reporting Properties permission can configure Grid Reporting Properties. Limited-access users can view the Grid Reporting Properties. When superusers create or delete any admin groups in NIOS, the corresponding roles are created or deleted on the reporting server. You cannot directly create or delete roles on the reporting server. If superuser permission is granted or removed from a NIOS group, this permission change will be reflected in the corresponding role on the reporting server. When you modify the name of an admin group on NIOS, make sure that you grant permissions again for all corresponding roles that are created on the Reporting and Analytics App for this renamed admin group. For information about granting permissions, see Granting Permissions.

Note: Limited-access users cannot create, modify, and delete any user role for the Splunk App.

Granting Permissions
Superusers can grant App permissions to limited-access users. Permissions for all reporting objects are migrated to the new Reporting solution and managed through the new user interface after an upgrade. You may see some new built-in roles, such as Everyone, when configuring Reporting permissions. For best practices, do not alter permissions for these new built-in roles. In addition, Reporting Dashboard and Reporting Search global permissions have been removed. If an admin group or admin role was granted these permissions before an upgrade, the permissions will still be displayed after an upgrade. However, they won't take any effect. The Grid Reporting Properties permission is retained.

**Note:** The App Permissions and Edit Permissions sections display only your assigned admin role on the reporting server. Therefore, you can only view the admin role to which your user name was assigned. Only the default system admin can view all admin roles.

To set permissions:

1. From the **Reporting** tab -> select the **Administration** tab.
2. Click **Permission** to manage permissions.
3. In the **App Permissions**, set permissions to **Read** and/or **Write** for the roles listed. You must have at least one permission (Read or Write) to execute a task on the **Reporting** tab.
4. Click **Save**.

**Figure 40.2 Setting Permissions for Reporting and Analytics App**

To modify permissions:

1. From the **Reporting** tab -> select **Dashboards** or **Reports** or **Alerts**.
2. From the **Edit** drop-down list, select **Edit Permissions**.
3. Specify the following:
   - Display for **Owner**, **App**, or **All Apps**. For more information about **All Apps** permissions, refer to the Splunk documentation.
   - Read and write privileges for users. By default, the permissions are set on the object. You cannot remove the Read and Write permissions completely. However, you can change this permissions from **Read** to **Write** or vice versa, based on your permissions. For more information about permissions, refer to the Splunk documentation.
4. Click **Save**.

Editing Permissions

Users can edit permissions for objects where they are the owner, such as dashboards, reports, and alerts. When a user creates a new report, dashboard or an alert, it is only available to that user. To make that object available to other users, you can do the following (only if your permissions allow you to do so):

- Make an object available to all users.
- Restrict or expand access to all or specific objects by roles.
- Set Read or Write permissions at the Reporting level for roles. For information about users and roles, refer to the Splunk documentation.
Configuring an External Server for Search Result Exports

You can configure an FTP, SCP, or TFTP server to which you plan to schedule the export of search results. Only superusers can configure the remote server and limited-access users cannot do so. When you upgrade to 7.3.x, make sure that you reconfigure an FTP, SCP, or TFTP server, even if you have already scheduled the export of search results. The Set up page to configure an FTP, SCP, or TFTP server is displayed for all new installations and upgrades if you have not previously scheduled the export of search results. If you have configured any scheduled export of search results in a previous NIOS release, NIOS migrates one of the server settings to the Reporting and Analytics App. In this case, the Set up page from the Reporting tab > Administration tab, as illustrated in Figure 40.3.

To configure an FTP, SCP, or TFTP server:

1. From the Reporting tab -> select the Administration tab -> click Set up.
2. To configure a remote server, complete the following:
   - **Username**: Enter the username of your server account.
   - **Password**: Enter the password of your server account.
   - **Confirm Password**: Enter the same password.
   - **Protocol**: Select FTP or SCP or TFTP from the drop-down list.
   - **Host/IP Address**: Enter the host IP address.
   - **Host Port**: Enter the port number on the selected server.
   - **Destination Path**: Enter the path and the file name of the export file. For example, you can enter /export/Infoblox_2009_10_20_15_30 on a Linux server, or c:/export/Infoblox_2009_10_20_15_30 on a Microsoft Windows server.
3. Click Save.

Figure 40.3 Setup Page to specify Server for Exporting Search Results

About Reporting Clustering

You can add higher scale, performance, and reliability to the Reporting and Analytics solution by using the reporting clustering feature. Through reporting clustering, you can combine and configure multiple reporting members in a cluster. These reporting members work together to provide greater performance with higher data throughput and indexing capacity. The cluster efficiently scales storage and indexing capacity. The reporting clustering feature also offers high availability and disaster recovery. You can configure one or more reporting appliances in multiple locations (sites). Reporting data is replicated among these reporting appliances to ensure redundancies and continuous service even if one of the servers fails. For example, if one of the reporting members has operational issues, reports and dashboards will use backup copies of the data on other reporting members in the cluster to ensure continuous reporting service. When a new reporting member joins the cluster, you do not need to reconfigure and restart your forwarders to send data to the new reporting member as the Grid Master automatically notifies all forwarders about
the new member. In addition, data indexed on the new reporting member participates in searches that support reports and dashboards. Thus, the new reporting clustering solution increases scale, offers higher reporting performance and greatly improves the reliability of the Reporting and Analytics solution.

The reporting clustering feature is supported on appliances running NIOS version 7.3.200 and later. For new installations and upgrades from a previous NIOS release to NIOS 7.3.200 and later, the appliance is set to the single indexer mode by default. For more information about how reporting clustering works and the types of clustering mode, see Clustering Overview and Reporting Cluster Modes.

**Note:** Reporting clusters are not supported in a Multi-Grid configuration.

### Clustering Overview

The concept of reporting clustering is to set up a group of reporting members within one site (location) or across multiple sites. When you configure multiple reporting members within one site, you are setting up a single-site cluster. Configuring multiple reporting members across different sites gives you a multi-site cluster, as illustrated in Figure 40.6. Single-site clusters and multi-site clusters provide scalability for storage and indexing capacity. They also offer the benefits of high availability and disaster recovery. Without reporting clustering, a reporting member is known as a single indexer.

A reporting cluster, either single-site or multi-site, consists of the following components that work together to perform reporting and clustering activities:

- **Cluster Master:** The cluster master coordinates all clustering activities and always runs on the Grid Master.
- **Indexer** (also known as cluster peer): An indexer that collects, processes, and indexes reporting data. It can also function as the originating indexer (source peer) or a replication target (target peer).
- **Forwarder:** A forwarder sends reporting data to the indexer for processing.
- **Search Head:** A search head handles search queries and distributes search requests to indexers in the cluster. One of the reporting members in the cluster will have double duties of being the indexer and search head.
- **Replication Factor:** This factor defines the number of copies of reporting data the cluster replicates and maintains. This is set to 2 by default for both single-site and multi-site clusters so the clusters can tolerate one reporting member failure without losing any data (since there will still be another copy of data available in the cluster).
- **Search Factor:** This factor defines the number of copies of searchable data. This is set to 2 for single-site clusters and set to 1 for multi-site clusters so the cluster can tolerate one reporting member failure without impacting search results (since there will still be a searchable copy of data available in the cluster).
- **ReportingSite Extensible Attribute:** This is an extensible attribute that you associate with reporting members in a multi-site cluster. For more information, see ReportingSite Extensible Attribute.

In a Grid that includes a reporting cluster, the Grid Master coordinates various activities across reporting members. In the reporting cluster, a reporting member can act as an indexer and/or a search head. It also participates in peer-to-peer data replication.

To configure a reporting cluster, you must first set up all the reporting members and enable the reporting service in the Grid. You can then select the reporting clustering type for your cluster. For more information about cluster types, see Reporting Cluster Modes. When you configure the reporting cluster, you must use an NTP server to synchronize the time of the Grid Master, Grid members, and reporting members.

### Reporting Cluster Modes

You must first enable the reporting service and configure one or more reporting members as needed before configuring the reporting cluster. When you enable reporting clustering, the Grid Master, forwarders, and reporting members use specific ports for network communication. Figure 40.4, Figure 40.5, and Figure 40.7 illustrates whether the network communication is over TCP/SSL or VPN, and ports that you can use for the reporting service.

- **Single Indexer:** This is the traditional configuration that works on one reporting server (indexer). The forwarder sends reporting data to the indexer and the indexer indexes the data. This is the default configuration when you enable the reporting service for new installations and when you upgrade from a previous NIOS release to NIOS 7.3.200 and later.

*Figure 40.4 Ports Required for IPv4 and IPv6 Single Indexer*
**Single-Site Cluster**: In a single-site cluster, the Grid Master is also the cluster master and all reporting members are cluster indexer peers. NIOS selects a peer and configures it as the search head to handle search queries. If the selected search head goes down, NIOS automatically selects another search head among the reporting members in the same site. All other Grid members (non-reporting members) are considered forwards that send reporting data to the cluster peers for processing. You must configure at least two reporting members that are located in the same site (location). By default, the replication factor and search factor for a single-site cluster are set to 2. Note that you can upgrade your configuration from a single-site cluster to a multi-site cluster. However, once configured, you cannot change your configuration back to a single indexer. For information about how to configure a single-site cluster, see Configuring Reporting Clusters.

**Multi-Site Cluster** - A multi-site clustering configuration is useful when you want to manage multiple reporting sites at different locations, with each site having its own set of indexers. The multi-site clustering configuration is valid only when you associate all the reporting members in the cluster with the predefined ReportingSite extensible attribute. For information about the ReportingSite extensible attribute, see ReportingSite Extensible Attribute. In a multi-site cluster, you configure one of the sites as the primary site, and then plan other sites in a specific order. This order defines the next site of indexers to which the forwards send data when the primary site is out of service. Note that all Grid members send data only to indexers in the primary site. You can designate a new primary site either by using the Grid Reporting Properties editor, or using the set promote_master CLI command. For more information about the CLI command, refer to the Infoblox CLI Guide. A multi-site cluster must have at least two sites with two reporting members in each site, as
The first reporting site that you configure is the primary site, which also hosts the search head for the cluster. If the search head goes down, the Grid Master automatically chooses an available reporting member in the same site as the search head. If all the indexers in a site go down, or if you want to change the search head to another site, then you must manually redefine the primary site. Note that you must make one of the active sites as the primary site. In a multi-site cluster, the search factor (also known as the site search factor) determines both the number of searchable copies that the entire cluster maintains and the number of copies that each site maintains. By default, the search factor is set to 1 and the replication factor is 2 in a multi-site cluster.

**Note:** You can change your configuration from a single indexer to a single-site cluster or multi-site cluster and from a single-site cluster to a multi-site cluster. However, you cannot revert your configuration from a multi-site cluster to a single-site cluster or to a single indexer.

### Clustering Data Replication

When you change the configuration from a single indexer to a single-site cluster or multi-site cluster and from a single-site cluster to a multi-site cluster, the replication of data will start only for the new data that are created after you have completed the cluster mode configuration. When you change the configuration, the replication of new data starts only after you have completed the clustering configuration. Any data created prior to switching are restored on the primary site and are not replicated on the secondary site. To manage your reporting clustering data efficiently, see [Guidelines for Deploying Reporting Clusters](http://docs.splunk.com/Documentation/Splunk/6.2.5/Indexer/Basicclusterarchitecture).

For more information about how reporting cluster works, refer to the Splunk documentation at [http://docs.splunk.com/Documentation/Splunk/6.2.5/Indexer/Basicclusterarchitecture](http://docs.splunk.com/Documentation/Splunk/6.2.5/Indexer/Basicclusterarchitecture).

**Figure 40.7 Port Requirement for IPv4 and IPv6 Multi-site Clustering**
ReportingSite Extensible Attribute

NIOS defines the ReportingSite extensible attribute for use by the multi-site cluster reporting configuration. You must associate a ReportingSite extensible attribute value with the reporting members defined in the cluster. For more information, see Assigning a Reporting Site EA Value to a Multi-Site Cluster. Note that your multi-site cluster configuration is invalid unless you assign ReportingSite values to all the reporting members that are part of the cluster.

You can add up to five ReportingSite extensible attributes, and view and edit the ReportingSite extensible attributes in the Administration tab -> Extensible Attributes tab in Grid Manager. You can view the ReportingSite extensible attribute values in the Grid -> Grid Manager -> Members tab in Grid Manager. The ReportingSite column is not available if you customize the Results table. You can enable the ReportingSite column by selecting Columns -> Edit Columns. For information, see Customizing Tables. You can also use the Group Results function to group reporting members that contain the same ReportingSite extensible attributes. For information about grouping members by extensible attributes, see Grouping Members by Extensible Attributes.

As illustrated in Figure 40.6, the ReportingSite value "site1" is assigned to a site within a multi-site cluster and to the reporting members RM1, RM2 and RM3. The ReportingSite value "site2" is assigned to a different site in the cluster and to reporting members RM4, RM5 and RM6. If the search head goes down, the Grid Master automatically chooses an available reporting member in the same site to be the search head.

Note: When you modify the ReportingSite extensible attribute value for any indexers in a multi-site cluster, ensure that you validate the configuration again, as described in Validating Reporting Clustering Configuration.

Monitoring Reporting Cluster Status

After you have set up reporting members and defined clustering type, you can monitor the cluster status through the following:

- View the reporting member service status, as described in Monitoring Grid Services.
- Check license usage by the reporting member, as described in Home Dashboards.

### Promoting the Grid Master Candidate in Multi-Site Clustering

If the Grid Master fails and all other reporting members are up and running in a multi-site reporting cluster, you must promote the Grid Master Candidate to the Grid Master by using the CLI command set promote_master. For information about the CLI command, refer to the Infoblox CLI Guide.

### Reporting Categories and Related Data Sources

The reporting member uses two types of data sources to generate reports: file-based data sources and script-based data sources. When the reporting member is down or unreachable, file-based data sources are queued until the reporting member is up and running. However, the script-based data sources are lost if the size of the queued data exceeds 500 KB.

The amount of data in the queue is managed as follows:

- Rotates the reporting syslog files (extracted from /var/log/messages) at 120 MB retaining one older file. The data in the queue depends on the file size when the reporting member becomes unreachable.
- The CSV files overwrite the oldest data with the new data at regular intervals. So, the CSV file contains only the latest events.

Table 40.3 lists the reports provided by the reporting server, report categories, and the source type, data source type (file or script-based), and queue data update frequencies for each report:

Configuring Reporting Clusters

You can configure a reporting single indexer, a single-site cluster, or a multi-site cluster. When you configure reporting clustering, make sure that you configure two or more reporting appliances and that all indexers are online.

Note: There is no action required if you see intermittent “Too many streaming errors” and “Skip indexing” messages in the Messages menu of the Reporting tab. This can be caused by network connectivity issues between the reporting nodes.

To configure a reporting cluster:

1. From the Administration tab -> Reporting tab, click Grid Reporting Properties from the Toolbar.
2. In the Grid Reporting Properties editor, select the Reporting Clustering tab and complete the following:
   - **Single Indexer**: Select this to configure only one reporting server. This is the default reporting cluster mode.
   - **Single-Site Cluster**: Select this if you want to configure two or more reporting servers in the same site (location). The data is replicated on multiple reporting servers. You can upgrade your configuration to the multi-site clustering mode, but you cannot revert this configuration to a single indexer mode.
   - **Multi-Site Cluster**: Select this if you want to configure multiple reporting servers at different sites (locations). You must assign the ReportingSite extensible attributes to all the reporting members that you have configured in the same site within the cluster. You can configure the same ReportingSite extensible attribute with multiple reporting members. The reporting members that are configured with the same ReportingSite extensible attributes are tagged to the same site. Click the Add icon and select the ReportingSite extensible attribute that you have configured on the reporting member. The first site that you add is considered to be the primary site, which functions as the search head. You can change the order of the sites by clicking the up and down arrows.

   For more information about the reporting cluster type, see Reporting Cluster Modes.

Note: Your multi-site configuration is invalid if you do not add the correct ReportingSite extensible attribute values to the reporting members. You can validate your configuration as described in Validating Reporting Clustering Configuration.

3. Click Save & Close.

Assigning a ReportingSite EA Value to a Multi-Site Cluster

The multi-site clustering configuration is valid only when you associate all the reporting members in the cluster with the specified ReportingSite e
xtensible attribute values. Make sure that you select the ReportingSite values from those that are specified for the multi-site cluster in the Grid Reporting Properties editor. After you assign extensible attribute values to the reporting members, you can validate the multi-site cluster configuration as described in Validating Reporting Clustering Configuration.

To associate the ReportingSite extensible attribute with the reporting member:

1. From the Grid tab, select the Grid Manager tab -> Members tab -> member check box, and then click Extensible Attributes in the Toolbar.
2. Click the Add icon in the Extensible Attributes table to enter extensible attributes. The appliance adds a row to the table each time you click the Add icon. Select the row and the attribute name from the drop-down list, and then enter the value.
3. Optionally, select an extensible attribute and click Delete to delete it.
4. Click Save & Close.

Validating Reporting Clustering Configuration

After you have configured the reporting cluster mode, you can verify its validity. Whenever you make changes to the reporting configuration through Grid Manager or hardware replacement, make sure that you validate the configuration.

When you verify a multi-site cluster configuration, NIOS validates the following:

- The extensible attribute ReportingSite is specified for all reporting members.
- The set of extensible attributes configured in the GridReportingProperties editor equals to the set of ReportingSite extensible attributes defined for the reporting members.
- For each ReportingSite extensible attribute, the number of reporting peers must be greater or equal to the replication factor in each site.
- For each ReportingSite extensible attribute, the search factor must be less than or equal to the replication factor in each site.

To verify the reporting cluster-mode configuration:

1. From the Grid tab -> Grid Manager tab, click the Reporting service.
2. In the vertical Toolbar, click Verify Cluster Configuration.
   The Verify Reporting Cluster Configuration dialog box displays an error message if the configuration is invalid. Make sure that you associate the ReportingSite extensible attributes with all the reporting members that you have configured.
3. Click OK to close the dialog box.

Guidelines for Deploying Reporting Clusters

The following are a few guidelines to consider before you deploy reporting clustering:

- **Best Practices for Capacity Planning**
- **Monitor Volume and Storage Consumption**
- **Deployment and Service Monitoring**
- **Best Practices for Customizing Searches**

Best Practices for Capacity Planning

- Forecast the usage of the reporting volume and disk size based on your business needs and estimate the future potential growth.
- Work with the your Infoblox representatives to gather statistics and metrics of your Grid to estimate the expected potential reporting data volume and disk storage required to manage your reporting data. This helps you determine which tier of NIOS Reporting license you should purchase, the number of appliances, and the appliance models you might need.
- Configure reporting appliances using the same hardware appliance models. The capacity of the whole cluster is limited by the weakest reporting member if you configure reporting members using different appliance hardware models.
- Consider the future potential growth during the initial deployment of a reporting cluster. Scaling out the reporting cluster by adding more reporting members at a later time might result in a significant configuration change.
- Unlike single-indexer reporting solution, there might be more than one solutions to handle certain estimated license and disk size for the reporting cluster. To reduce the potential admin overhead, Infoblox recommends that you use a small number of high-end reporting appliances to form a cluster, rather than using a large number of low-end reporting appliance.
- When deploying a reporting cluster in a virtual environment, consider the following:
  - You can deploy clustering in a virtual environment as long as it provides adequate system resources and capacities. Refer to the following resources to help design the clustering deployments. They provide information about best practices and consequences that you should be aware of when configuring the host environments:
    - http://docs.splunk.com/Documentation/Splunk/6.3.3/Capacity/Referencehardware
    - https://www.splunk.com/web_assets/pdfs/secure/Splunk_and_VMware_VMs_Tech_Brief.pdf
    - https://answers.splunk.com/answers/238/can-i-run-splunk-in-a-vm-are-there-any-issues-or-tricks-i-should-be-aware-of.html
  - If you expect to deploy the reporting cluster in multiple data centers to achieve disaster recovery in the future, then configure the multi-site reporting clustering for the first time, even if all reporting members are physically located in the same data center. You can move some of the reporting members to other data center at a later time as required, rather than deploying new reporting members and reconfiguring the multi-site cluster.

**Note:** Be aware that the additional reporting members (the secondary site in the same data center) doesn't really increase the capacity of the
• Reporting cluster can only tolerate single node failure.
  • By default, the replication factor is set to 2, which means that there are two copies for each bucket in the entire single-site cluster or each site for a multi-site cluster. Therefore, it can tolerate failure only on one node.
  • The cluster may not be able to tolerate double failure. For example, if node1 just recovered from a failure and if node2 fails before node1 is fully recovered (before turning everything to green). In such cases, there is a chance of losing some data.
  • When you change the reporting cluster mode, be aware of the following:
    • The data indexed by a single-indexer is not replicated to other peers, even if upgraded to a single-site cluster. Similarly, the data indexed by a single-site cluster is not replicated to other sites, even if upgraded to a multi-site cluster. In other words, the single-indexer configuration does not support HA configuration and single-site data does not have disaster recovery measure. Note that when you restore the reporting data created in a single-site cluster to a multi-site cluster, the data is restored only on the primary site of the cluster and are not replicated on the secondary site.

Monitor Volume and Storage Consumption

• Monitor the license volume usage on the reporting server regularly using the following dashboards:
  • Monitor the Today’s License Usage (GB) and License Usage Trend Per Member panels available in the Home Dashboards
  • Reporting License Usage
  • Reporting Volume Usage Trend per Category
  • Reporting Volume Usage Trend per Member
• Configure alerts in the Infoblox Reporting and Analytics App to trigger actions when data volume reaches a specified limit.
• Monitor the disk usage: You can monitor the disk usage for each index in the Grid Reporting Properties editor and adjust the breakdown among indexes to make sure that the data is retained for the desired period of time.
• Take actions when the license volume or disk usage approaches the limit.
  • Choose to obtain licenses that can manage your data volume.
  • Expand the cluster with additional reporting members to increase the disk volume. If there is a surge of reporting data generation before you upgrade your license, you may reduce the inbound volume by turning off reporting on certain Grid members or certain reporting categories.
• Do not ignore license violation warnings, such as GUI yellow banner and SNMP traps.
  • When reporting license usage approaches the limit, NIOS displays the warning messages in the yellow banner, log messages, and SNMP traps (if configured).
  • When you receive five (5) violation notifications in a rolling period of 30 days, you cannot view reports or configure report related functions. To avoid reporting interruptions, promptly address any violation notifications by contacting Infoblox Technical Support.

Note: The reporting server continues to process incoming data during the violation state. However, you cannot view any report or manage any report related functions until you fix the violation issue.

Deployment and Service Monitoring

• A reporting cluster requires that the Grid Master and reporting members have the same IPv4 or IPv6 configurations.
  • Use either IPv4 or IPv6 networks for all members. There might be an impact on the performance if you use both IPv4 and IPv6 networks. There are a few guidelines to consider before you deploy reporting clustering. For more information about the guidelines, see Guidelines for Deploying Reporting Clusters.
  • Be aware of the time lag in displaying the actual state in the reporting service status.
    • NIOS reporting monitors all communication between Splunk cluster master (on the Grid Master) and reporting members, between Grid members (forwarders) and reporting members, and among reporting members.
    • Grid Manager displays the service status to indicate any network issues. However, the status is not real-time and there might be some time lag up to 5 minutes from the moment when the issues occur or recover.
  • Regularly backup your reporting data even for a multi-site cluster deployment. Infoblox recommends that you perform reporting data backup before changing your configuration from a single indexer to a single-site cluster or multi-site cluster and from a single-site cluster to a multi-site cluster. For information, see Backing Up Reporting Data.
  • Use the Reporting Clustering Status dashboard to monitor the reporting cluster status, as described in the Reporting Clustering Dashboard.
    • If the reporting cluster is functioning properly, then the overall status is green. The status turns red if there is any network outage or reporting member goes offline, which indicates that the replication factor or search factor is not met. It might take some time for Grid Manager to change the status to green even after you fix the issue because the cluster needs to replicate buckets among peers.
  • There can be duplicated bucket data in the reporting backup FTP server.
    • In the cluster mode configuration, there is a chance of uploading multiple copies of the same bucket because reporting data backup takes data from multiple reporting members simultaneously. However, the reporting data restore process eliminates the duplicate copies of such buckets.
  • It is a good practice to backup the Infoblox Reporting and Analytics App regularly, even though the appliance backs up data from the running search head to the Grid Master periodically. By doing this, it is easier to recover the data automatically by the new search head in case of a search head failure. For information, see Backing Up and Restoring the Infoblox Reporting and Analytics App.
Other Best Practices for Deploying Reporting Clusters

- When you plan a single site or multi-site reporting cluster, make sure that you join all the relevant reporting members to the cluster immediately. Any delays in adding the reporting members might cause some data loss because peers are unable to start indexing immediately. In addition, Infoblox recommends that you validate the reporting clustering configuration before you start the reporting service, as described in Validating Reporting Clustering Configuration.

- When you need to bring down any reporting members for reasons such as maintenance and the member will be back online soon, you can use the set_reporting_cluster_maintenance_mode CLI command to suppress the cluster master to initiate any bucket fix-up activities. For more information about this command, refer to the InfobloxCLI/Guide. After completing the maintenance, use the same (set_reporting_cluster_maintenance_mode) CLI command to turn off the reporting cluster maintenance mode.

- When you upgrade from a previous release to NIOS 7.3.200 or later, the Grid will automatically be upgraded to the single indexer mode. You can change the reporting clustering configuration after the upgrade.

- When you upgrade from NIOS 7.3.200 to a later NIOS release, the Grid will retain the cluster type configured in NIOS 7.3.200.

- During a scheduled upgrade, reporting members will restart and become unavailable to receive events from other Grid members. To avoid the scenario that all reporting members might go offline about the same time, Infoblox suggests that you put reporting members in different upgrade groups and schedule different upgrade times for these upgrade groups. By doing so, there will always be some reporting members available to receive data from other Grid members. Thus, you can avoid potential data loss during scheduled upgrades.

- When you upgrade from a previous release to NIOS 7.3.200 or later, reporting data generated before you enable reporting clustering is replicated on all reporting members. Therefore, in cases when a reporting appliance is down or offline, you may experience some data loss (although this data will be captured in the reporting backup file). Infoblox recommends that you back up your reporting data before an upgrade or enabling reporting clustering.

- You cannot revert the NIOS software version after you have configured a single-site or multi-site cluster from the single indexer mode. For example, if you upgrade the Grid from NIOS 7.3.0 to NIOS 7.3.200 or later with reporting service enabled (only the single indexer mode is supported until NIOS 7.3.200), the Grid will automatically be upgraded to a single indexer mode. If you then configure a single-site or multi-site cluster after the upgrade, you cannot revert to a single indexer in the upgraded version. To configure a single indexer, you must revert the NIOS software version to NIOS 7.3.0, which may cause some data loss because not all data stored on different reporting members in the previous reporting cluster is consolidated to the single indexer.

- When you plan to move a reporting appliance from one Grid to another, you must first enable the reporting service in the new Grid and then join the reporting appliance.

- Infoblox recommends that you do not reboot the reporting appliance or restart the reporting service when performing reporting backups or restores. For information, see Backing Up Reporting Data and Restoring the Reporting Database.

- Infoblox recommends that you use appliance models with the same capacity as peers in a cluster. If you set up a reporting cluster using heterogeneous models, the appliance displays a warning message and limits the capacity of the entire cluster based on the peer that has the smallest capacity. For information about how to validate the reporting configuration, see Validating Reporting Clustering Configuration.

The following table provides example configurations for the single-site and multi-site clustering:

<table>
<thead>
<tr>
<th>Clustering Types</th>
<th>Configuration Details</th>
<th>Validation</th>
</tr>
</thead>
<tbody>
<tr>
<td>Single-site clustering (Replication Factor = 2)</td>
<td>Forwarder volume = 2GB per day Licensing Master: 1 X 5G Primary Site: 2 X TR-1400 (5G)</td>
<td>Yes</td>
</tr>
<tr>
<td></td>
<td>Forwarder volume: 5GB per day Licensing Master: 1 X 10G Primary Site: 2 X TR-2200</td>
<td>Yes</td>
</tr>
<tr>
<td></td>
<td>Forwarder volume: 8GB per day Licensing Master: 2 X 10G Primary Site: 4 X TR-2200</td>
<td>Yes</td>
</tr>
<tr>
<td></td>
<td>Forwarder volume: 8GB per day Licensing Master: 1 X 20G Primary Site: 2 X TR-4000</td>
<td>Yes</td>
</tr>
<tr>
<td></td>
<td>Forwarder volume: 8GB per day Licensing Master: 1 X 10G Primary Site: 2 X TR-2200</td>
<td>No</td>

<tr>
<td></td>
<td>Forwarder volume: 8GB per day Licensing Master: 1 X 10G Primary Site: 4 X TR-2200 Backup Site: 2 X TR-2200</td>
<td>Yes</td>
</tr>
</tbody>
</table>

Table 40.4 Clustering Configuration Examples
Grid Reporting Properties

After you set up a dedicated reporting appliance in your Grid, you must configure the Grid reporting properties so you can communicate with the reporting appliance and retrieve report data through the Grid Master. In addition, you must select the correct report categories in order for the reporting server to generate the correct data in corresponding reports, as described in Configuring Grid Reporting Properties. By default, only superusers can configure the Grid reporting properties. When you enable the Grid reporting service, all members transmit data to the reporting server. You can disable data transmission from specific members to the reporting server. Before using the reporting service, you must configure the remote server to export the search results, as described in Reporting (Index) Storage Space. Once you configure the reporting server and enable the reporting service on Grid members, you can view and manage reports through the Reporting tab of Grid Manager.

Note: When you reset the appliance using the CLI command reset all or reset the database using the CLI command reset database, the reporting configurations are not preserved. If you reset the appliance, you must configure Grid reporting properties and remote server settings to use the reporting service.

Complete the following to configure the Grid reporting properties:

1. From the Administration tab -> Reporting tab, click Grid Reporting Properties from the Toolbar.
   or
   From the Grid tab, select the Grid Manager tab and click the Services tab. In the Services tab, select the Reporting tab and click Edit -> Grid Reporting Properties from the Toolbar.
2. In the Grid Reporting Properties editor, select the General -> Basic tab
3. Complete the following:
   - Reporting Server: Grid Manager displays the name of the reporting server.
   - Enable Data Indexing: Data transmission is disabled by default. You must select this check box to ensure that all Grid members transmit data to the reporting appliance. Enabling data transmissions for all members can affect the overall data consumption on the reporting server. For information about the daily maximum data consumption per day for your reporting appliance, see Table 40.5.
   - Report Category: Select the reports you want the reporting server to generate. The reporting server automatically configures data sources and configurations required to generate the reports you select here. The required data is stored in the reporting server database. By default, no report categories are selected. For a list of report categories, see Predefined Dashboards. You must select at least one reporting category for the reporting service to start working.
     - Index%: Displays the actual storage space allocated for a reporting index. You can modify this value between 0 and 100. When you enable an index category and leave it at 0%, the appliance displays an error message. Make sure that the total percentage of the index storage space for all report categories equals 100% or less than 100%. The appliance displays a warning message when the total percentage of the index storage space is less than 100%.
     - Used%: Displays the index storage space used by a reporting index.
     - IndexName: Displays the reporting index name, which are displayed on the Reporting Index Usage Statistics report.
4. Save the configuration and click Restart if it appears at the top of the screen.

Configuring Grid Reporting Properties

After you configure the reporting server, you must enable the data indexing and select at least one reporting category to ensure that the reporting service functions properly.

Note: You must select the correct report categories in order for the reporting server to generate the correct data in corresponding reports.

Complete the following to set up your reporting solution:

- Configure general reporting properties, including the selection of report categories, as described in Configuring Grid Reporting Properties.
- Specify the network port for reporting, as described in Setting the Network Port for Reporting.
- Specify email properties, as described in Configuring Email Notification Settings.
- Configure logo image for PDF delivery, as described in Configuring Logo Image in PDF Reports.

The properties you define in the Grid Reporting Properties editor apply to all the reporting members, unless you override them at specific member level. To override at the member level, see Modifying Member Reporting Properties.

Reporting (Index) Storage Space

One key configuration aspect of the reporting appliance is index space. By default, some percentage of index space is allocated on the reporting server for each report category listed in Table 40.3. For information about how to configure index space, see Configuring Grid Reporting Properties.
Each report category uses up to a certain percentage of the usable reporting hard disk space for index storage. For example, of the total 237 GB usable hard disk space of an IB-VM-800 appliance, the reporting category, **Device** uses 47.47%. For the list of default index space configured for each report category, see Table 40.5. You can modify the index percentage value between 0 and 100. When you modify this value, make sure that the total percentage for the index storage space for all categories equals exactly 100%. You can set the index percentage to a value less than 100% to reserve certain percentage for future use. If the total percentage of the index space usage exceeds 100%, the appliance displays an error message. Note that the reporting appliance removes the oldest data when you reduce the index space percentage for a category to a value that is lower than the used percentage by the existing data. For information about the maximum index size and number of days the reporting data is retained, see Table 40.8. Also, ensure that its host name has only alphanumeric characters, underscores, dots, and dashes.

**Note:** For usable reporting hard disk space for each appliance model, see Table 40.2.

### Table 40.5 Default Index Space Configured for Each Report Category

### Modifying Member Reporting Properties

To modify reporting properties for a reporting member:

1. From the **Grid** tab -> **Grid Manager** tab -> **Services** tab, select the **Reporting** service and click the **Grid_member** check box, and then click the **Edit** icon.
2. In the **Reporting Member Properties** editor, select the **General** tab and click **Override**.
3. Under **Reporting Settings**, complete the following:
   - **Enable data forwarding to the indexer on this member**: Select this check box to enable data transmissions to the reporting server. If you do not select this check box, a member will not forward data to the indexer and reporting service is disabled on that member.
   - **Select the data categories to forward**: Select the report categories for which you want this member to forward data to the reporting server. Clear the report categories for which you do not want this member to forward data to the reporting server.

**Note:** The member configured as an indexer displays only the **Audit Log** category.

4. Save the configuration.
Defining Interface for Reporting Traffic

On a Grid member, you can define the network interface you want the member to use for sending reporting data to the reporting server. To define network interface on the Grid member for reporting traffic, complete the following:

1. From the Grid tab -> Grid Manager tab -> Services tab, select the Reporting service and click the Grid_member check box, and then click the Edit icon.
2. In the Reporting Member Properties editor, select the General -> Advanced tab, and then complete the following:
   - Forwarding interface used for reporting traffic: From the drop-down list, select the interface that you want this member to use to send reporting data. Note that you must properly configure the interfaces on the member for them to appear in the drop-down list.
   - After a NIOS upgrade to version 8.1.x or later, if you had selected Any from the drop-down list, the LAN1 (or VIP for HA configurations) subnet is used as the static route. Select MGMT if you want to continue using the management port for grid communication. Selecting MGMT enables the MGMT subnet to be used as the static route.
   - Statistics Collection Top Grid_member (minutes): Enter the time in HH:MM:SS AM/PM format. You can also click the Clock icon to select a time from the drop-down list.

3. Save the configuration.

Setting the Network Port for Reporting

All Grid members use port 9997 for reporting service by default. This port is used for data transmissions between the reporting member and other members. Ensure that you configure your firewall rules to allow traffic on this port. You can designate another network port for reporting purposes. To set the network port for reporting:

1. From the Administration tab, select the Reporting tab -> expand the Toolbar and click Grid Reporting Properties. or
2. From the Grid tab -> Grid Manager tab -> Services tab, select the Reporting service and click the Grid_member check box, and then click Edit -> Grid Reporting Properties from the Toolbar.
3. In the Grid Reporting Properties editor, select the General -> Advanced tab and complete the following:
   - Port: Enter the port number you want to use for reporting purposes. The default port is 9997.
   - Interface: Enter the interface you want to use for sending data to the reporting server.

4. Save the configuration.

Specifying the Data Generation Interval for Reports

You can specify the time interval when the appliance generates data for the DNS Statistics per View and DNS Statistics per Zone reports. The default value for the data generation interval for these reports is one day (86400 seconds). You can specify different data generation intervals for the DNS Statistics per View and DNS Statistics per Zone reports.

To specify the data generation interval for DNS Statistics per View and DNS Statistics per Zone reports:

1. From the Administration tab, select the Reporting tab -> expand the Toolbar and click Grid Reporting Properties. or
   - From the Grid tab -> Grid Manager tab and click the Services tab. In the Services tab, select the Reporting tab and click Edit -> Grid Reporting Properties from the Toolbar.
2. In the Grid Reporting Properties editor, select the Data Generation Schedule tab and complete the following:
   - Data Generation: Enter the time in HH:MM:SS AM/PM format. You can also click the Clock icon to select a time from the drop-down list.
   - Interval: Enter the interval in minutes. You can also click the Clock icon to select an interval from the drop-down list.

3. Save the configuration.

For more information about the reports, see DNS Statistics per DNS View and DNS Statistics per Zone

Configuring Threat Protection Data

You can use this feature only if the Threat Protection and Threat Protection Update licenses are installed on the Infoblox Advanced Appliance. When you configure this feature, you receive threat protection events in the syslog. The events logged include threat protection rules and the source IPs that triggered the rules. For information about how to monitor these events using the syslog, see Monitoring through Syslog.

For certain threat protection reports, accumulated statistics for each unique IP/rule pair are collected. You can control the volume of data collected per member using the following options:

- Top IP/Rule Statistics Collection Limit: This option limits the collection of accumulated statistics to the top N unique IP/rule pairs.
- IP/RuleStatisticsCollectionInterval(minutes): The interval at which the accumulated statistics for the top N unique IP/rule pairs are collected. The smaller the interval, the finer the granularity of the accumulated statistics in terms of time, but the data volume will be higher.

Based on your configuration, the reporting appliance displays data in the following threat protection reports:

- Threat Protection Top Rules Logged
- Threat Protection Top Rules Logged by Source

Copyright ©2019, Infoblox, Inc. All right reserved.
**Note:** When threat details are missing for a non-local RPZ feed zone entries, it is recommended to check if the associated feed zone’s TSIG key is configured.

**Note:** To enable threat protection reports, you must select the Security report category in the Grid Reporting Properties editor. To select the Security check box, go to the Reporting tab -> Grid Reporting Properties -> General tab -> Basic tab -> select the Security check box under Report Category. Ensure that you set the Security Index% to an optimal level so the reporting database has enough storage space to accommodate all reporting data. For information about how to configure the index %, see Configuring Grid Reporting Properties.

To configure the data collection limit:

1. From the Administration tab, select the Reporting tab and click Grid Reporting Properties from the Toolbar.
   or From the Grid tab, select the Grid Manager tab and click the Services tab. In the Services tab, select the Reporting tab and click Edit -> Grid Reporting Properties from the Toolbar.
2. In the Grid Reporting Properties editor, select the Threat Protection tab and complete the following:
   - **Top IP/Rule Statistics Collection Limit:** Enter the maximum number of the top N unique source IP/rule pairs for data collection. For example, if you specify 20, the appliance collects data for the top 20 unique source IP/rule pairs.
   - **IP/Rule Statistics Collection Interval (minutes):** Enter the time interval at which the reporting appliance updates data. For example, if you specify the interval as 60 minutes, the appliance updates data at a 60 minute interval.
3. Click Save & Close.

**Monitoring DNS Client Queries**

You can view the presence of clients in the network that are sending large numbers of queries to DNS zones or DNS domains. To monitor the top clients querying DNS zones, do the following:

1. From the Administration tab, select the Reporting tab -> expand the Toolbar and click Grid Reporting Properties.
   or From the Grid tab, select the Grid Manager tab and click the Services tab. In the Services tab, select the Reporting tab and click Edit -> Grid Reporting Properties from the Toolbar.
2. In the Grid Reporting Properties editor, select the Basic tab -> DNS.
3. Under DNS Top Clients Per Domain, select the Monitor Queries made to the following zones check box. Only authoritative zones are supported, to a limit of 1000 zones for monitoring purposes.
   - To select zones one at a time, choose individual check boxes. Click the Add icon and select Add Domain or Bulk Add Domains to add new zone information for excluding.
   - To specify the number of clients to be listed, choose the Top N Limit value. The default value is 10.

**Monitoring IP Block Group Queries**

You can view the user defined IP block groups that are querying DNS domains. To monitor the IP Block Groups, do the following:

1. From the Administration tab, select the Reporting tab -> expand the Toolbar and click Grid Reporting Properties.
   or From the Grid tab, select the Grid Manager tab and click the Services tab. In the Services tab, select the Reporting tab and click Edit -> Grid Reporting Properties from the Toolbar.
2. In the Grid Reporting Properties editor, select the Basic tab -> DNS.
3. Under DNS Query trend per IP Block, select the Monitor Queries made from the following groups check box.
   - Click the Add icon to add a group to the group table. From the drop-down list, click Select Group to select groups in the Group Selector dialog box, or click Bulk Add Groups to add multiple groups.
   - To select all groups, select the Group check box. Or, select individual check box to select the group one at a time.
   - To delete a group, select the group and click the Delete icon.

**Configuring DNS RPZ Rule Hits**

You can specify a limit to display the number of top clients, who receive re-written responses through the RPZ, in DNS Top RPZ Hits. You can also specify the total number of RPZ entries for each client.

1. From the Administration tab, select the Reporting tab -> expand the Toolbar and click Grid Reporting Properties.
   or From the Grid tab, select the Grid Manager tab and click the Services tab. In the Services tab, select the Reporting tab and click Edit -> Grid Reporting Properties from the Toolbar.
2. In the Grid Reporting Properties editor, select the Basic tab -> DNS.
3. Under DNS RPZ Rule Hit Configuration, complete the following:
   - Enter a value for Top N Limit to specify the maximum number of top clients that can be listed in the report.
   - Specify the Total RPZ Entries per Client. This indicates the number of entries for each client in RPZ.

**Note:** You have to select the Security check box before you define values here. To select the check box, Reporting tab -> Grid Reporting Properties -> General tab -> Basic tab -> select the check box Security under Report Category.

---

Copyright ©2019, Infoblox, Inc. All rights reserved.
Forwarding Syslog Data to the Reporting Server

You can control the kind of syslog data forwarded to the indexer from the Grid members. You can search for syslog events (search string) in the Reporting tab -> Search tab. The syslog events you see in the Search tab depends on the syslog categories that you specify in both the Grid Reporting and Member Reporting Properties. The Search tab displays syslog events for the selected syslog categories at both the Grid Reporting Properties and Member Reporting Properties. For information, see About Searches.

To specify syslog data categories:

1. From the Administration tab, select the Reporting tab -> expand the Toolbar and click Grid Reporting Properties. 
or
   Member: From the Grid tab, select the Grid Manager tab and click the Services tab. In the Services tab, select the Reporting tab -> m ember check box and then click the Edit icon.
2. In the Grid Reporting Properties or Reporting Member Properties editor, select the Syslog Data tab and complete the following:
   Click Override in the Reporting Member Properties editor to override the settings configured at the Grid reporting level. To inherit the same properties as the Grid, click Inherit.
   - **Source:** From the drop-down list, select which syslog messages the appliance sends to the external syslog server:
     - Any: The appliance sends both internal and external syslog messages.
     - Internal: The appliance sends syslog messages that it generates.
     - External: The appliance sends syslog messages that it receives from other devices, such as syslog servers and routers.
   - **Severity:** Choose a severity filter from the drop-down list. When you choose a severity level, the appliance sends log messages with the selected levels and the levels above it. The severity levels range from the lowest, debug, to the highest, emerg. For example, if you choose debug, the appliance sends all syslog messages to the server. If you choose err, the appliance sends messages with severity levels err, crit, alert, and emerg.
     - **Send selected categories:** Select this to configure logging categories from the list of available logging categories. Use the arrows to move logging categories from the Available table to the Selected table and vice versa. The appliance sends syslog messages for the categories that are in the Selected table. When you select this option, you must add at least one logging category.
     - The syslog messages are prefixed with a category name to which it belongs. Also, the RPZ events logged in the syslog messages uses specific prefixes for the selected categories. Note that the syslog messages are prefixed when you set logging categories for at least one external syslog server, even if you set other external syslog servers as Send All.

3. Save the configuration and click Restart if it appears at the top of the screen.

About IP Blocks and IP Block Groups

You can configure IP addresses, subnets, or a mix of multiple IP addresses and subnets into IP blocks, and then assign them to IP block groups for monitoring and tracking queries made to specific IP blocks. For information about adding IP addresses, see Adding IP Blocks. You can also configure as many groups as necessary and assign them to specific clients. Note that assigning more IP block groups results in monitoring more queries, which may affect the performance of the reporting server. You can generate a report to monitor queries made to these user-defined IP block groups or IP blocks. For information, see DNS Query Trend per IP Block Group.

Guidelines while configuring IP blocks:

- You cannot configure arbitrary IP address ranges, such as 192.168.0.1 to 192.168.0.100 as an IP block.
- You cannot add or modify an IP block that overlaps with another IP block in a different group. However, you can add an IP block that overlaps with another IP block in the same IP block group.

Note: The appliance restarts the DNS service after you assign or unassign an IP block group at the Grid or member level. Also, the appliance restarts the DNS service when you modify or delete an IP address or IP block group assigned to the Grid or member or when you add, modify, or delete an IP block in such IP block groups.
You can do the following in the Groups panel:

- Add IP block groups, as described in Adding IP Block Groups.
- Modify IP block groups, as described in Modifying IP Block Groups.
- Add IP block, as described in Adding IP Blocks.
- Modify IP blocks, as described in Modifying IP Blocks.
- Delete IP block groups and IP blocks, as described in Deleting IP Block Groups and IP Blocks.
- Print IP block groups and IP blocks, as described in Printing IP Block Groups and IP Blocks.
- Export IP block groups and IP blocks, as described in Exporting IP Block Groups and IP Blocks.

In addition, you can also do the following:

- Use filters or the Go to function to navigate to a specific group. You can also create quick filters to save frequently used filter criteria. For information about how to use quick filters, see Using Quick Filters.
- Use Global Search to search for IP block groups and IP blocks. For information, see Global Search.
- Use Smart Folders to organize IP block groups and IP blocks. For information, see About Smart Folders.
- Import and export groups in CSV format. For more information about CSV import feature, see About CSV Import.

Adding IP Block Groups

To add a new group:

1. From the Administration tab, select the Reporting tab -> Group -> Add.
   or
   From the Administration tab, select the Reporting tab, expand the Toolbar and click Add -> IP Block Group.
2. In the Add IP Block Group wizard, complete the following:
   - Name: Enter the name of the group.
   - Comment: Enter useful information about the group.
3. Do one of the following:
   - Click Save & Close to add the IP block group and close the wizard.
   - Click Save & Edit to add the IP block group and launch the editor. You can edit the details.
   - Click Save & New to add the IP block group and launch the wizard again to add another group.
   - Click Save & Open to add the IP block group and open the IP block group.

Modifying IP Block Groups

1. From the Administration tab, select the Reporting tab -> Group -> Edit.
2. In the General tab of the IP Block Group editor, you can modify the group name and comment.
3. Click Save & Close to save the configuration.

Note: You can perform inline editing by double-clicking the row of data that you want to modify. The appliance displays the inline editing editor in the selected row. Click Save after modifying the data.

Adding IP Blocks

In a group, you can add as many subnets/IP addresses as necessary. Note that adding more IP addresses results in monitoring more queries, which may affect the performance of the reporting server.

1. From the Administration tab, select the Reporting tab -> Group -> Add.
   or
   From the Administration tab, select the Reporting tab, expand the Toolbar and click Add -> IP Block.
2. In the Add IP Block wizard, complete the following:
   - Group: Click Select to select a group. When there are multiple groups, Grid Manager displays the Group Selector dialog box to select a group. Click a group name in the dialog box. You can use filters or the Go to function to narrow down the list.
   - Address: Enter the source IPv4/IPv6 addresses or the IPv4/IPv6 subnets.
   - Comment: Enter useful information about the IP block.
3. Do one of the following:
   - Click Save & Edit to add an IP address or IP block and launch the editor. You can edit the details.
   - Click Save & New to add an IP address or IP block and launch the wizard again to add another IP block.
   - Click Save & Close to add an IP address or IP block and close the wizard.

Modifying IP Blocks

1. From the Administration tab, select the Reporting tab -> Group.
2. Select an IP address or IP block you want to modify and click the Edit icon.
3. In the General tab of the IP Block editor, modify the IP address or comment.
4. Click Save to save the configuration.

**Note:** You can modify description by using inline editing. Double-click the row that you want to modify, the appliance displays the inline editing editor in the selected row. Click Save after modifying comment. You cannot modify IP address using inline editing editor.

### Deleting IP Block Groups and IP Blocks

1. For IP block groups: From the Administration tab, select the Reporting tab -> Group.
2. For IP blocks: From the Administration tab, select the Reporting tab -> Group -> IP block.
3. Click the Delete icon.
4. In the Delete Confirmation dialog box, click Yes.

### Exporting IP Block Groups and IP Blocks

You can export displayed data or you can export the group list in CSV (comma separated value) format. Exporting group lists or group data may take a few moments based on the amount of exported data.

**To export displayed data:**

1. For IP block groups: From the Administration tab, select the Reporting tab -> Group.
2. For IP blocks: From the Administration tab, select the Reporting tab -> Group -> IP block.
3. From the Export drop-down menu, select Export visible data. For more information on how to export, see Exporting Displayed Data.

**To export all data to a CSV file:**

1. For IP block groups: From the Administration tab, select the Reporting tab -> Group.
2. For IP blocks: From the Administration tab, select the Reporting tab -> Group -> IP block.
3. From the Export drop-down menu, select Export data in Infoblox CSV Import format. For more information on how to export, see Exporting Data to Files.

### Printing IP Block Groups and IP Blocks

1. For IP block groups: From the Administration tab, select the Reporting tab -> Group. For IP blocks: From the Administration tab, select the Reporting tab -> Group -> IP block.
2. Click the Print icon. For more information on how to print, see Printing from Grid Manager.

### Reporting User Interface Overview

When you access the Reporting tab in Grid Manager, you can do the following:

- View and analyze all of your DNS, DHCP, and IPAM data.
- View the reporting data in the form of charts and tables.
- Use the Search tab to create or edit searches.

The key options in the Reporting tab are: Home Dashboards, Dashboards, Reports, Alerts, Search, Pivot, Administration, and Reporting Help. For more information about these options, see Table 40.6. Figure 40.8 Reporting Tab Overview
The following table summarizes the different tabs and key options that are available in the Reporting tab:

<table>
<thead>
<tr>
<th>Tab Name</th>
<th>Purpose</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Settings</td>
<td>Email notification settings Server Logging</td>
<td>For information, see <a href="#">Configuring Email Notification Settings</a></td>
</tr>
<tr>
<td>Home Dashboard</td>
<td>Overall summary view for the reporting data in your Grid</td>
<td>For information, see <a href="#">Home Dashboards</a></td>
</tr>
<tr>
<td>Dashboard</td>
<td>Provide table and graph views for the reporting data in your Grid.</td>
<td>For information, see <a href="#">Home Dashboards</a></td>
</tr>
<tr>
<td>Reports</td>
<td>Saved searches that retrieve specific type of reporting data</td>
<td>For information, see <a href="#">About Reports</a></td>
</tr>
<tr>
<td>Alerts</td>
<td>Set alerts to trigger actions when certain events occur</td>
<td>For information, see <a href="#">About Alerts</a></td>
</tr>
<tr>
<td>Search</td>
<td>Create a search interactively from scratch and save it as a dashboard panel, alert and report.</td>
<td>For information, see <a href="#">About Searches</a></td>
</tr>
<tr>
<td>Pivot</td>
<td>Refer to Splunk documentation for more information.</td>
<td></td>
</tr>
<tr>
<td>Administration</td>
<td>• Set up</td>
<td>For information, see <a href="#">Reporting (Index) Storage Space</a></td>
</tr>
<tr>
<td></td>
<td>• Permissions</td>
<td>For information, see <a href="#">Administrative Permissions</a></td>
</tr>
<tr>
<td>Reporting Help</td>
<td>Quick help on some of the reporting topics.</td>
<td></td>
</tr>
</tbody>
</table>

Hierarchy settings for all the navigation menu options (listed in the Table 40.6) are available in the default.xml file.

**WARNING:** Infoblox recommends that you do not modify the default.xml file. The navigation menu is built on a custom XML structure that is stored as default.xml in the navigation directory (from the Reporting tab, select the Settings tab -> User Interface -> Navigation Menus -> default). Editing this file changes the specific default settings for the reporting features and your changes become permanent. In addition, you might not be able to see the latest changes made by Infoblox. To restore the default settings, you must reset the NIOS appliance to its original factory settings. For information, see [Resetting a NIOS Appliance to Factory Settings](#).
**Home Dashboards**

You can view the overall summary of DNS, DHCP, and IPAM activities in the **Home Dashboard** page. This page presents a summary view of the following:

- **DDI Summary**: Presents statistical information about the DNS, DHCP, and IPAM activities of all Grid members.
- **DNS**: Displays the statistical summary of DNS activities. You can export the search results, open in search, and refresh.
- **DHCP**: Displays the statistical summary of DHCP activities. You can export the search results, open in search, and refresh.
- **IPAM**: Displays the summary of the **Top10/IPAMv4UtilizedNetworks** dashboard.
- **Reporting Health**: You can view the license usage by the reporting server:
  - **Today’s License Usage**: Current license usage by the indexer.
  - **License Usage Trend per Member**: License usage by the indexer per member.

![Figure 40.9 Reporting Home Dashboard](image)

**About Searches**

Searches are criteria that the reporting server uses to save reports and dashboard panels. Each predefined report has an associated search. For more information, refer to the official Splunk documentation: [http://docs.splunk.com/Documentation](http://docs.splunk.com/Documentation).

To run a search:

1. From the **Reporting** tab, select the **Search** tab.
2. Enter the search criteria and then click the Search icon.

The search results are displayed in the **New Search** panel, as illustrated in the **New Search View**. In the **New Search** panel, you can save search results as **Reports**, **Dashboard Panel**, and **Alerts**. When you deploy reporting clustering, we enable Splunk configuration to prevent data loss from forwarders, which may cause duplicated events in the indexer under certain circumstances. When you view reports and dashboards, the events that are already deduped are not duplicated again. However, if you view raw search events (such as write your own search against the indexed data directly), you may still see the duplicated events.

The search results are based on the most seen events for the dashboards listed in **Table 40.7**. To know more about dedup searches, reports, or dashboards, refer to [http://docs.splunk.com/Documentation/Splunk/6.3.3/SearchReference/Dedup](http://docs.splunk.com/Documentation/Splunk/6.3.3/SearchReference/Dedup).

**Note**: When you click **Open in Search**, the content of the entire page (alert/dashboard/report) is encoded and displayed in the **Search** page. To avoid encoding, go to **Activity** -> **Jobs**. The **Jobs** page lists the search job history in the form of links. The top one is the latest search job executed by the alert or dashboard or report. The search string is not encoded when you click this link to run the search.

**Table 40.7 Dashboards and Deduplicate Key(s)**

Best Practices for Customizing Searches
You can optimize the performance of your reporting server and more efficiently view and manage your reports. Depending on the type of search and the data you want to search for, Infoblox recommends that you use the following guidelines:

- Specify shorter start and end times whenever possible.
- Time range is one of the most important factor for search performance. Depending on the number of events that need to be loaded from the disk, it might take a long time when you specify a wider time range as it involves a large amount of data.
- Be specific about the fields you use.
  - Rare searches are faster than dense searches, so be specific whenever possible.
  - Start a search from a smaller dataset and then gradually apply it to bigger dataset.
  - When experimenting searches, start with a small date and time range, and then apply it to a bigger time range only when it is optimized.
- If a search is running for a long time, you can use the Pause and Stop buttons.
- You can tune the search criteria and run it again if you stop an ongoing search jobs.
- Configure the panels to display data only if you have specific input instead of adding too many panels to the dashboard.
- Scheduling expensive searches.
  - You can configure reports and dashboards by scheduling searches because prefetched search results are displayed each time the reports and dashboards are opened. This reduces the workload on the reporting server without data freshness.
- Stagger scheduled searches.

Try to stagger your searches whenever possible. When you define how often the reporting server runs a search, be aware of other searches that the server is running. When you schedule the server to run many searches at the same time, the server performance can be negatively affected.

Creating Reports from a Search

You can create reports by saving a search as a report. To save a search as a report:

1. From the Reporting tab, select the Search tab.
2. Enter the search criteria and then click the Search icon. The search results are displayed in the New Search panel.
3. From the Save As drop-down list, click Report to generate a report.
4. Enter title and description.
5. Click Save.
6. Do one of the following in the Your report has been created dialog box:
   - Click View to view your report on the Report page.
   - Click Continue Editing to edit.
   - Click Add to Dashboard to add new report to the dashboard panel.

You can also complete the following settings in the Your report has been created dialog box:

- Permissions: Click this to edit permissions for your report, as described in Editing Permissions.
- Schedule: Click this to schedule a report. For information about scheduling reports, see Scheduling Reports.
- Acceleration: For more information, refer to the Splunk documentation.

Saving a Search as a Dashboard Panel

You can save a search as a dashboard panel.
Do the following to save a search as a dashboard panel:

1. From the Reporting tab, select the Search tab.
2. Enter the search criteria and then click the Search icon. The search results are displayed in the New Search panel.
3. From the Save As drop-down list, click Dashboard Panel to create a dashboard panel.
4. Click View Dashboard to view dashboard in the Dashboard panel. For information, see Home Dashboards.

Exporting Search Results

You can export the data in the selected search in CSV (comma separated value) or XML format. Note that this may take a long time depending on the amount of data you want to export. To schedule the export of search results to an FTP or SCP or TFTP server configured in the Setup page, select File Transfer Action when creating a scheduled alert, as described in Creating Scheduled Alerts.
To export data in a selected search:

1. From the Reporting tab, select the Search tab.
2. Enter the search criteria and then click the Search icon. The search results are displayed in the New Search panel.
3. Click the Export icon to export search results.
4. In the Export Results dialog box, complete the following:
   - Format: Select CSV or XML from the Format drop-down list.
   - File Name: Specify a file name for the export file. This is optional.
   - Number of Results: (Limited or Unlimited). If you select Limited, enter the number of results to be exported in the Max Result
Saving Search as Alerts

To save a search as an alert:

1. From the Reporting tab, select the Search tab.
2. Enter the search criteria and then click the Search icon.
3. From the Save As drop-down list, click Alert.
4. In the Save As Alert dialog box, specify all alert settings. For information about scheduling alerts, see Creating Scheduled Alerts.
5. Click Save.

About Alerts

You can configure alerts to trigger actions when certain events occur. When you set up an alert, search results trigger an alert action if they match the alert conditions. You can configure an alert to send an email notification, SNMP trap, and log a message in the syslog. Note that alerts are executed based on update frequencies for each corresponding search. For example, DHCP Lease History alerts are executed every 10 minutes, and Device Trend alerts are executed every 30 minutes at the 17th and 47th minutes of each hour (one minute after the search updates). For information about search indexes and update time intervals, see Reporting Indexes and Update Time Intervals. You can also throttle an alert if you want to change its frequency. For more information, refer to the Splunk documentation.

You can do the following in the Alerts page:

- Create scheduled alerts, as described in Creating Scheduled Alerts.
- Edit permissions, as described in Editing Permissions.
- Edit alert type, trigger condition, and alert actions, as described in Editing Alerts.
- Clone an alert, as described in Cloning Alerts.

Creating Scheduled Alerts

You can schedule an alert to notify when a scheduled report returns results that meet a specific condition. The appliances sends an alert when it encounters the trigger condition.

1. From the Reporting tab, select the Alerts tab -> select an alert and click Open in Search.
2. From the Save As drop-down list, click Alert.
3. In the Save As Alert dialog box, complete the following:
   - Specify the title and description.
   - Alert Type: Select Scheduled
   - Time Range: Specify the time range. For example you can select Run Every Day.
   - Schedule At: Specify the time.
   - Trigger Condition: Specify trigger conditions. For more information, refer to the Splunk documentation.
   - Trigger Actions: Click this to configure alert actions. You can select the following:
     - Send SNMP Trap: Select this to enable SNMP traps. For information about how to trigger SNMP traps for reporting event types, see Defining Thresholds for Traps.
     - Send email: Select this to send alert notification through email. You can specify email address in the To text box.
     - Send to Syslog: Select this to log a message in the syslog. If you configure this option with an alert, the message goes to the syslog on the reporting member or indexer.
     - File Transfer Action: Select this to upload the search results to an FTP or SCP or TFTP server configured in the Set up page. For information, see Reporting (Index) Storage Space.
4. Click Save.

Editing Alerts

You can edit alert type, trigger condition, and alert actions, as follows:

1. From the Reporting tab, select the Alerts tab -> select an alert.
2. From the Edit drop-down list, select Edit Alert Type and Trigger Condition to edit alert settings. In the Edit Alert Type and Trigger Condition dialog box, make the required changes. For information, see Creating Scheduled Alerts.
   or
   From the Edit drop-down list, select Edit Actions to edit alert actions. In the Edit Actions dialog box, make the required changes. For information, see Creating Scheduled Alerts.
3. Click Save.

Cloning Alerts
1. From the Reporting tab, select the Alerts tab.
2. Select an alert you want to clone, click Edit -> Clone.
3. Enter a new title, ID, and description. Click Clone Alert.
4. Optionally, you can click Open in Search to open the cloned alert in the Search page.
5. Click View, and do one of the following in the You report has been created dialog box:
   - Click View to view your report on the Report page.
   - Click Continue Editing to edit.
   - Click Add to Dashboard to add new report to the dashboard panel.

You can also complete the following settings in the You report has been created dialog box:

- Permissions: Click this to edit permissions for your report, as described in Editing Permissions.
- Schedule: Click this to schedule a report, as described in Scheduling Reports.
- Acceleration: For information, refer to the Splunk documentation.

### Configuring Email Notification Settings

You can enable the appliance to send email messages to specified recipients when the alert is triggered. You can configure email settings for alerts, scheduled reports, and scheduled PDF delivery.

To configure email properties for alerts and PDF delivery:

1. From the Reporting tab -> Settings tab -> click Server settings.
2. Click Email settings.
3. Specify the mail host. The default is local host.
4. Optionally, you can specify user name and password.
5. Specify Email Format.
6. In the Specify PDF Report Settings, specify the paper size, paper orientation, and also the path to logo image.
7. Click Save.

**Note:** You can configure email addresses when scheduling dashboard PDFs, scheduling reports, and creating alerts.

### About Reports

Infoblox provides reports that are named by core network service functions, such as DNS query and system utilization. Reports contain predefined search criteria that retrieve specific data from the reporting database. Each report is associated with a search. It is not recommended to modify predefined reports. However, when you run a search, you can save it as reports and share it with other users. You can also create a new report by cloning an existing report, and then modify the search criteria.

You can also create a personal report in two different ways:

- Clone a report, as described in Cloning Reports.
- Saving a search as a report, as described in Creating Reports from a Search.

**Note:** IDNs are not supported on the reporting server. The reporting server manages IDNs in punycode. The reports generated by collecting reporting data from the DNS server displays all the data in punycode only.

When you upgrade to 7.3.x, all NIOS Global reports are migrated to the Dashboards panel without filters. However, the filter conditions configured in NIOS are reflected in the Dashboards panel. All NIOS System and Global searches are migrated to the Reports panel.

You can do the following in the Reports tab:

1. From the Reporting tab, select the Reports tab -> select a report.
2. In the Reports panel, you can do the following:
   - Open a report in the Search page and edit the report using the Save As menu. For information, see About Searches.
   - You can do the following using the Edit drop-down list:
     - Edit Description
     - Edit Permissions, as described in Editing Permissions.
     - Edit Schedule, as described in Scheduling Reports.
     - Clone a report, as described in Cloning Reports.

### Reporting Indexes and Update Time Intervals

Table 40.8 lists the search indexes that the reporting server uses to generate reports. It contains information about the frequency of the summary report updates for each report and the percentage of the total index space allocated for each report category. Use this information to plan your reporting strategy for the Grid so you can optimize the performance of the reporting server.

Each summary report or search has its own update frequency. For example, the DNS Top Requested Domain report updates its data every 30 minutes, starting at the 4th minute of each half hour. It collects report data during the first 30 minutes of the previous 60 minutes. For example, if the report starts an update at 6:04 a.m., the data it collects is from 5:04 a.m. to 5:34 a.m.

The reporting server also uses this information to generate alerts. For example, once configured, Top Devices Identified alerts are executed at the...
17th and 47th minutes of each hour (one minute after each update), regardless of whether DHCP fingerprint detection is enabled or disabled. For information about alerts, see About Alerts.

Note: The maximum retention period for the reporting data is 136 years. However, the data is removed from the database if the data exceeds the maximum limit for a reporting index and when the data crosses the retention period (after 136 years).

</tbody>
</table>

**Note:** When you filter a dashboard by a time frame that is larger than the maximum retention period, the reporting server returns data within the maximum retention period. For example, when you try to view data of the CPU Utilization Trend report for the past six months, the server only returns data up to the last two months.

### Cloning Reports

1. From the **Reporting** tab, select the **Reports** tab.
2. Select the report you want to modify, click **Edit -> Clone**.
3. Enter a new title, ID, and description.
4. Set its permissions. Select Private if you do not want to share the cloned report with other users. Select Clone if you want the cloned report to have the same permissions as the original report.
5. Click Clone Report.
6. Optionally, you can do the following:
   - You can edit permissions, as described in Editing Permissions.
   - Click View to view the cloned report.
   - Click Add to Dashboard to add the cloned report to the dashboard.

Click Open in Search to open the cloned report in the Search page.

Scheduling Reports

You can schedule a report to run on a scheduled interval and trigger an action each time it runs. When scheduling a report, you can set up an action to send an email to receive report results. In addition, you can export results in CSV (comma separated value) or XML format.

To schedule a report:

1. From the Reporting tab, select the Reports tab.
2. Select the report you want to schedule, click Edit -> Schedule.

Note: You can schedule a report when you save search results as reports. When you set the paper size to A5, the logo image and report name may overlap in the footer of the downloaded reports or reports sent through email.

3. In the Edit Schedule dialog box, select the Schedule Report check box.
4. Enter the Schedule and Timerange. For more information about how to use the Schedule and Timerange options, refer to the Splunk documentation.
5. Click Next and do the following to set an action for the scheduled reports:
   - Send Email: Select this to send an email to a set of recipients to receive report results in text format, or as CSV or PDF attachments.
     - Enter the email address in the To text box. To send the email message to multiple recipients, type a comma between email addresses.

Figure 40.12 Edit Schedule

- In the Include section, select one of the following: Inline Table, Attach CSV, Attach PDF. Selecting Attach PDF or Attach CSV attaches the results of the report in the form of a CSV file or a PDF. Make sure that you specify this information.

Note: Infoblox recommends not to select Link to Report, Link to Results, Search String in the Include section. These links might not work in
Configuring Logo Image in PDF Reports

All reports display the Infoblox logo by default. You can customize reports by removing the Infoblox logo, or by replacing it with your own company logo. The reporting server uses the latest image file that you have uploaded. Make sure that you upload a logo file that is in PNG format and has a file size that is smaller than 500 KB. Note that the image file name must be pdf_logo_image.png. Do not change the logo image file name. You can configure your PDF reports and schedule to send them through emails. For information about scheduling the delivery of reports, see Scheduling Reports.

Note: In the footer of the report, you can view the logo image (if uploaded), panel name, and the timestamp when the report was downloaded. When there is no data in a single panel report, the downloaded PDF displays "No Results Found" along with "Last Updated" information. However, a report with multiple panels displays only the panel name for the panel that does not have any data.

To upload logo image:

1. From the Administration tab, select the Reporting tab -> expand the Toolbar and click Grid Reporting Properties.
   
   or
   
   From the Grid tab, select the Grid Manager tab and click the Services tab. In the Services tab, select the Reporting tab and click Edit -> Grid Reporting Properties from the Toolbar.
2. In the Grid Reporting Properties editor, select the PDF tab and complete the following:
   
   - **Logo Image**: Click Upload to open the Upload dialog box. Click Select to navigate to where the image file is located and click Open. Click Upload to upload the file. The appliance displays a preview of how it will appear on reports after you successfully upload the logo file. You can click Clear to remove the logo and upload a new one. Make sure that the file format and size meet the requirements; otherwise, the appliance displays an error message. You can click Clear to remove the uploaded image file.
3. Click Save & Close.

About Dashboards

Dashboards provide summary views for most of the data and trends in your Grid. Infoblox recommends not to modify default dashboards. To modify settings of a default dashboard, you can either clone a default dashboard, or create a new dashboard from scratch and then add panels and reports. For example, you can create a new dashboard called "DNS and DHCP Activities," and then add DNS report, add DHCP related reports, such as DHCP Top Lease Clients and DHCP Lease History, to the new dashboard. When you save the "DNS and DHCP Activities" dashboard, the reporting server saves all the reports added to the dashboard and displays dashboard with updated data. By doing this, user-defined dashboards can provide single point of access to review multiple reports that are relevant to the activities you want to monitor. If you modify a default dashboard, you can reset it to its default settings. Each dashboard comes with a set of filters to further refine report data, as described in About Dashboard Filters.

When you upgrade to 7.3.0 or later, all your system reports are migrated to Reporting tab > Dashboards.

**WARNING:** Infoblox recommends that you do not modify the predefined dashboards even if you have appropriate permissions. Editing the default dashboards changes the default settings and your changes become permanent. In addition, you might not be able to see the latest changes made by Infoblox. You can select a default dashboard and clone it to modify any of the settings, such as permissions, panels, and so on. For information, see Cloning Dashboards.

In the Dashboard panel, you can do the following using the Edit drop-down list:

- Edit panels as described in Editing Dashboards.
- Edit source, title, and description.
- Edit permissions as described in Editing Permissions.
- Clone a dashboard as described in Cloning Dashboards.
- Reset dashboards, as described in Resetting Dashboards.

Creating New Dashboards

When you add a new dashboard, Grid Manager displays it in the Reporting -> Dashboards tab. You can add multiple panels and reports to the new dashboard. For information, see Editing Dashboards.

To create a new dashboard:

1. From the Reporting tab -> select the Dashboards tab.
2. Click Create New Dashboard.
3. Complete the following:
   
   - **Title**: Enter the dashboard title.
   - **Description**: Dashboard description.
* Permissions: Click Shared in App to share a dashboard to other users. Depending on their permissions, other users can edit the dashboard. When Private is selected, the dashboard is available only to the user who creates it. You can change permissions later while editing a dashboard.

4. Click Create Dashboard.

Cloning Dashboards

It is not recommended to modify default dashboards. You can select a default dashboard and clone it to modify any of the settings, such as permissions, panels, and so on.

Note: You do not need any permission to create, modify, and delete your own personal dashboard. However, limited-access users need Read and Write permissions to modify cloned dashboards. For information about administrative permissions, see Administrative Permissions.

When you clone a dashboard, you can do the following:

- View and set permissions, as described in Editing Permissions.
- Schedule PDF delivery, as described in Scheduling PDF Delivery for Dashboards.
- Edit panels, as described in Editing Dashboards.

To create a personal dashboard:

1. From the Reporting tab, select the Dashboards tab.
2. Select the dashboard you want to modify, click Edit -> Clone.
3. Enter a new title, ID, and description.
4. Set its permissions. Select Private if you do not want to share the cloned dashboard with other users. Select Clone if you want the cloned dashboard to have the same permissions as the original dashboard.
5. Click Clone Dashboard.
6. Optionally, you can edit permissions, as described in Editing Permissions or click View to view the cloned dashboard.

Resetting Dashboards

Infoblox recommends not to modify default dashboards. However, when you make changes to the default dashboards, you can reset to its default settings.

To reset a dashboard:

1. From the Reporting tab -> select the Administration tab.
2. Click Reset Dashboards.
3. Select the check box of the dashboard or Select all to select all the dashboards.
4. Click Reset selected dashboards.

The dashboard you have modified will reset to its default settings.

Editing Dashboards

To edit the panels and filters of a dashboard, it is recommended to clone the default dashboard, and then add panels, filters and reports to the cloned dashboard. When you add a report to the panel, Grid Manager generates the corresponding dashboard in the panel. When you save the dashboard, Grid Manager updates reports in each panel. Alternatively, you can edit the XML source code to add filters and panels to a cloned dashboard, as described in Editing the XML Source Code of a Dashboard.

To add panels and filters to a dashboard:

1. From the Reporting tab -> select the Dashboards tab -> select a dashboard.
2. From the Edit drop-down list, select Edit Panels.
3. In the Edit: <Dashboard> pane, you can click Add Panel or Add Input or Edit Source.

Note: You cannot modify or delete the default values set for the dashboard filters. For example, you cannot delete or modify the filter All set for Members. When you add a new input using the editor, make sure that you edit the source and refer to the token for the input in the search string. By doing so, the search is updated when you change the input value. For information editing source, refer to Splunk documentation.

4. Optionally, you can click to delete a filter. When you delete a filter, make sure that you delete the filter information from the XML source code as well. For information, see Editing the XML Source Code of a Dashboard.

5. Expand the panel categories and select the panel you want to add. For detailed information about how to add panel categories, refer to the Splunk documentation.

6. Click Add to Dashboard.
Editing the XML Source Code of a Dashboard

**Note:** Before editing dashboards, forms, and panel files in simple XML source code, you should be familiar with the basic layout of dashboards and the XML elements that define them. Infoblox recommends that you save a copy of the source code of the dashboard before making any modifications.

To edit the XML source code for a dashboard:

1. From the **Reporting** tab, select the **Dashboards** tab.
2. Select a dashboard you want to edit the XML source code, click **Edit -> Edit Source**.

You can add filters, such as check box, drop-down list, radio button, and text box. For information about how to edit the XML source code, refer to the Splunk documentation.

Example - Adding an extensible attribute filter

If your reporting data contains the "location" extensible attributes associated to members, adding the following sample XML code to the XML source code will create an extensible attribute filter, **Member Location**:

```xml
<input type="dropdown" token="ea_location">
  <label>Member Location</label>
  <choice value="All">All</choice>
  <default>All</default>
  <search>
    <query> | inputlookup __grouping_by_ea_tag_lookup 
      | spath input=EA path=Location output=EA_Location 
      | stats count by EA_Location </query>
    <earliest>$time.earliest$</earliest>
    <latest>$time.latest$</latest>
  </search>
  <fieldForLabel>EA_Location</fieldForLabel>
  <fieldForValue>EA_Location</fieldForValue>
  <change>
    <condition value="All">
      <set token="ea_location_str"> | noop </set>
    </condition>
    <condition value="*">
      <set token="ea_location_str"> | spath input=EA path=Location output=EA_Location 
        | where EA_Location="$value$" </set>
    </condition>
  </change>
</input>

<search id="base_search">
  <query>index=ib_system_summary report=si_cpu_usage
    $members$
    $ea_site_str$
</query>
</search>
```
The generated PDF appears in a browser window. You can view, download, or print the PDF from the browser window. A single dashboard PDF includes up to 1,000 rows of table data.

Do the following to print a dashboard:

1. From the Reporting tab, select the Dashboards tab -> select a dashboard.
2. Click Print. The default print driver for your browser opens with print settings.

### Scheduling PDF Delivery for Dashboards

To schedule PDF delivery for dashboards, you must first create a new dashboard. Ensure that email notification settings are configured prior to scheduling PDF delivery. For information, see Configuring Email Notification Settings. To schedule PDF delivery, you can use the dashboard Edit drop-down list. You can access the Edit drop-down list directly from a dashboard or from the Dashboards page.

**Note:** Scheduled PDF delivery is not available for dashboards that include forms.

Do the following if the Schedule PDF Delivery option is disabled:

1. Open the dashboard for which you want to schedule PDF delivery.
2. Click Open in Search icon available at the bottom of the dashboard panel.
3. From the Save As menu, click Dashboard Panel.

To set up PDF delivery for the dashboard with a single panel:

1. From the Reporting tab, select the Dashboards tab.
2. Do one of the following:
   - Select the dashboard you want to schedule, click Edit -> Schedule PDF Delivery. If the Schedule PDF Delivery option is disabled, follow the steps as described above.
   - Open the dashboard in the Dashboards page and click Schedule PDF Delivery from the Edit drop-down list.
3. In the Edit PDF Schedule dialog box, do the following:
   - Select the Schedule PDF Delivery check box to enable PDF delivery.
   - Select a schedule. For more information, refer to the Splunk documentation.
   - In the Email To text box, specify email address.
   - Select paper size and paper layout. You can change the paper size and paper layout, if data is not displayed properly in the PDF delivery.
   - To receive dashboard PDFs immediately, click Send Test Email.
4. Click Save.

**Note:** To set up PDF delivery for the dashboard with multiple panels, repeat the above steps from step 1 to step 4 and add other panels to the dashboard created for the first panel.

*Figure 40.13 Edit PDF Schedule dialog box*
About Dashboard Filters

You can apply different filters to control the data displayed in the dashboards. The data on the dashboard is displayed based on the various filter criteria you select.

To apply a filter:

1. From the Reporting tab, select the Dashboards tab -> select a dashboard.
2. Apply filter criteria appropriately and click Submit.
   The dashboards display results based on the filters that you apply.

The most common filters are as follows:

- **Time**
- **Top N**: Top most filter options. The default is 10. You can select from a set of fixed values for the TopN filter setting: 5, 10, 20, 50, 100, 200, 250, or 500.
- **Members**: Grid members configured on the appliance.
- **Network**
- **Member Site**, as described in Applying Extensible Attribute Filters.

Applying Time Filters
You can generate a dashboard for a specific time interval by applying time filters. You can filter results by preset time ranges, create custom time ranges, specify time ranges based on dates or date and time, or work with advanced features in the time range picker. For information about Time range picker, refer to the Splunk documentation.
The date and time displayed in the Time filters are based on the time zone set in your user profile by default. For more information about how to configure a time zone, see Setting the Browser Time Zone. However, the timestamp displayed in the results for a dashboard is based on the time zone configured on the reporting server.

**Note:** The NIOS reporting data is updated at a certain time interval, rather than updating continuously. Therefore, the Real-time option in the Time filter might not work for most of the dashboards. For information about update time intervals, see Reporting Indexes and Update TimeIntervals.

### Applying Extensible Attribute Filters

You can use extensible attribute filters to narrow down the search by including only members that contain certain extensible attribute values. An extensible attribute added to a member is displayed in the Extensible Attribute filter. For information about managing extensible attributes, see About Extensible Attributes. When you configure group-by-extensible-attribute search and apply the Extensible Attribute filter, the dashboard displays results for grouped members that have the same extensible attribute value for the Site extensible attribute. If you have configured multiple attribute values for a member, then applying the Extensible Attribute filter displays all the attribute values associated with that member. For example, if member 1 has predefined attribute Site with attribute values member a and member b and member 2 has predefined attribute Site with attributes values member c and member d, then the dashboard displays member a and member b when you apply the Member Site < member 1 > filter.

In addition, you can apply Group By EA Tag filter and group members with the same extensible attribute value so that instead of displaying data per member, the reports display data per group of members with the same value for the Site extensible attribute. When you apply Group By EA Tag filter, you can set the data calculation method to decide which statistic value [Aggregate, Average, or Maximum] you want to be displayed for grouped members. You can group by Active Directory Sites for the IPAMv4 Network Usage Statistics report, IPAMv4 Top Utilized Networks report, and DHCPv4 Network Usage Statistics report.

To apply an extensible attribute and group by EA tag/field filters:

1. From the Reporting tab, select the Dashboards tab -> select a dashboard.
2. In the filter section, complete the following:
   - **Member <Extensible Attribute>:** Select an extensible attribute configured for a member. If you need an additional extensible attribute filter, you must first clone the default dashboard, and then add an extensible attribute filter by editing the XML source code. For information, see Editing the XML Source Code of a Dashboard.
   - **Group By EA Tag/Field:** Select an extensible attribute to enable the reporting server to group networks by members that have certain extensible attribute tags or fields. Note that this option is available for specific dashboards only.

**Note:** If you use special characters in the extensible attribute name, the appliance replaces these special characters with equivalent values. For example, if you add the extensible attribute Site In London, it is displayed as Site20In20London in the Group By EA Tag/Field drop-down list. In this example, space is replaced with 20. If you add the extensible attribute London@, it is displayed as London40 in the Group By EA Tag/Field drop-down list.

- **Calculation Methods:** This field is enabled only when you select the Group by EA Tag/Field check box. The displayed result varies based on your search definitions. The result values can contain information such as event counts, DNS queries, traffic rate, and usage trends. For example, when you select Maximum, the DNS Query Rate by Member dashboard shows all the members that have the same extensible attributes and members with the maximum DNS queries, and the Threat Protection Event Count By Member dashboard shows the members that have the same extensible attributes and maximum event counts. Select one of the following methods:
  - **Aggregate:** Displays the sum of values for individual members in a group.
  - **Average:** Displays the mathematical average of a group. This value is obtained by adding values for all members in a group and then dividing the total by the number of members.
  - **Maximum:** Displays the maximum value among the members in a group.

**Note:** When you apply Group By EA Tag/Field in Active Directory Sites supported reports, the values displayed in these reports are aggregated sum of absolute values (sum of values of individual networks in a group) and utilization% is the mathematical average of the group.

You can configure the group-by-extensible-attribute filter and data calculation methods for the following dashboards only:

- CPU Utilization Trend (Detailed)
- IPAMv4 Network Usage Statistics
- IPAMv4 Top Utilized Networks
- IPAMv4 Network Usage Trend
- DDNS Update Rate Trend
- DHCPv4 Usage Statistics
- DNS Daily Query Rate by Member
- DNS Query Rate by Member
- DNS Daily Peak Hour Query Rate by Member
- DNS Response Latency Trend
- DNS Cache Hit Rate Trend
- DNS Traffic Control Resource Availability Trend

Audit Log Events
The Audit Log Events dashboard provides information about the administrator-initiated events such as login events, logout events, service restarts, appliance reboots, write operations such as the addition, modification, and deletion of objects, etc. The default dashboard displays the audit log events for all admin users and for all Grid members in table format. You can use the displayed fields as filters to get specific information you want displayed in the dashboard. Only superusers can view and modify this dashboard.
This dashboard displays the following information about each audit log event in table format:

- **Timestamp**: The date, time, and time zone the task was performed. The time zone is the time zone configured on the member.
- **Admin**: The admin user who performed the task.
- **Action**: The action performed. This can be one of the following: Called, Created, Deleted, Login_Allowed, Login_Denied, Message, Modified, and Logout.
- **Object Type**: The object type of the object involved in this task.
- **Object Name**: The name of the object involved in this task.
- **Execution Status**: The execution status of the task. Possible values are Executed, Normal, Pending Approval, and Scheduled.
- **Message**: Detailed information about the performed task.
- **Members**: The Grid member on which the task was performed.

IPAMv4 Utilization Reports

DHCPv4 Top Utilized Networks
The DHCPv4 Top Utilized Ranges dashboard provides statistics about the top most utilized DHCPv4 networks. The default dashboard includes the top 10 most utilized DHCPv4 networks within the last 24 hours.
This dashboard displays the following information in table format:

- **Timestamp**: The date and time of the recorded utilization.
- **Network View**: The network view.
- **Network**: The network address.
- **CIDR**: The subnet mask in CIDR format.
- **DHCPv4 Utilization%**: The percentage of DHCP addresses in use over the total number of DHCP addresses provisioned.
- **Ranges**: The number of DHCP address ranges in the network.
- **Provisioned**: The total number of IP addresses in the range.
- **Dynamic**: The number of dynamic IP addresses in the range.
- **Static**: The number of static IP addresses in the range.
- **Free**: The number of free DHCP addresses.
- **Used**: The total number of IP addresses in use.

DNS Statistics per DNS View
The DNS Statistics per DNS View dashboard provides DNS zone statistics for each DNS view in a given time frame. The default dashboard includes information for all network views, all members, all IPv4 and IPv6 reverse-mapping zones, all forward-mapping zones, and all DNS records by record type.
This dashboard displays the following information in table format:

- **Timestamp**: The date and time of the event.
- **View**: The DNS view.
- **Members**: The FQDN of the member that is associated with the DNS view.
- **Forward-Mapping Zone**: The number of forward-mapping zones.
IPv4 Reverse-Mapping Zone: The number of IPv4 reverse-mapping zones.
Signed Zone: The number of signed zones.
Host: The number of host records.
LBDN: Number of LBDNs assigned to the zone. Note that if an LBDN is assigned to multiple zones or views, the appliance displays it separately for each zone or view.
Total Records: The total number of DNS resource records.

Grid Manager also displays the number of each relevant DNS resource records.

DNS Statistics per Zone

Since every DNS view can have multiple zones and each zone can have multiple records, this dashboard highlights the list of all zones and provides statistics based on every DNS Zone. This dashboard allows you to identify how many and what type of DNS records each zone is serving and use these statistics for more effective planning. The DNS Statistics per Zone displays the following information:

- Timestamp: Timestamp of events.
- Zone: FQDN of zone.
- Signed: Boolean to indicate if the zone is signed.
- Hosts: Number of hosts.
- LBDN: Number of LBDNs assigned to the zone. Note that if an LBDN is assigned to multiple zones or views, the appliance displays it separately for each zone or view.
- Total Records: Number of total resource records, Host are not counted.
  - A Records: number of A records.
  - AAAA Records: number of AAAA records.
  - CNAME Records: number of CNAME records.
  - DNAME Records: number of DNAME records.
  - DNSKEY Records: number of DNSKEY records.
  - DS Records: number of DS records.
  - MX Records: number of MX records.
  - NAPTR Records: number of NAPTR records.
  - NSEC Records: number of NSEC records.
  - NSEC3PARAM Records: number of NSEC3PARAM records.
  - NSEC3 Records: number of NSEC3records.
  - NS Records: number of NS records.
  - PTR Records: number of PTR records.
  - RRSIG Records: number of RRSIG records.
  - SOA Records: number of SOA records.
  - SRV Records: number of SRV records.
  - TXT Records: number of TXT records.
  - Other Records: number of other records.

IPAMv4 Network Usage Statistics

The IPAMv4 Network Usage Statistics dashboard provides usage statistics for each network in a given time frame. This dashboard displays the following information in table format:

- Timestamp: The timestamp when the network container was created.
- Network: The network address.
- Network View: The network view.
- CIDR: The subnet mask in CIDR format.
- AD Site: The Active Directory Site associated with the network. For networks that are not associated with Active Directory Domains and Sites, or when you delete an Active Directory server, the appliance displays no_value in this column.
- DHCPv4 Utilization%: The percentage of DHCP addresses in use over the total number of DHCP addresses provisioned.
- Total: The total number of IPAM addresses in the network.
- Allocated: The number of allocated IP addresses in the network.
- Reserved: The number of reserved IP addresses in the network.
- Assigned: The number of assigned IP addresses in the network.
- Utilization%: The percentage of IP address in use over the total number of IP addresses in the network.
- Unmanaged: The number of discovered IP addresses that do not have corresponding records on the appliance, such as A records, PTR records, fixed address records, host records, or leases.

IPAMv4 Network Usage Trend
The **IPAMv4 Network Usage Trend** dashboard provides IPAM usage trends for the network utilization in specific Active Directory Sites over time. Each of the line graphs is represented with a different color. This is a detailed report only. You can aggregate the report based on the networks or Active Directory Sites. This dashboard displays the following information:

- **Time**: The timestamp of the event.
- **Usage%**: The percentage of IPAM address network usage.

**IPAMv4 Top Utilized Networks**

The **IPAMv4 Top Utilized Networks** dashboard provides statistics about the top most utilized IPv4 networks. The default dashboard includes the top 10 most utilized networks within the last hour. This dashboard displays the following information in table format:

- **Timestamp**: The date and time of the recorded utilization.
- **Network View**: The network view.
- **Network**: The network address.
- **CIDR**: The subnet mask in CIDR format.
- **ADSite**: The Active Directory Site associated with the network. For networks that are not associated with Active Directory Domains and Sites, or when you delete an Active Directory server, the appliance displays **no_value** in this column.
- **DHCPv4 Utilization%**: The percentage of IP address in use over the total number of IP addresses in the network.
- **Total**: The total number of IP addresses in the network.
- **Assigned**: The total number of IP addresses assigned in the network.
- **Reserved**: The total number of reserved IP addresses in the network.
- **Unmanaged**: The number of discovered IP addresses that do not have corresponding records on the appliance, such as A records, PTR records, fixed address records, host records, or leases.

**DNS Object Count Trend for Flex Grid License**

The **DNS Object Count Trend for Flex Grid License** dashboard lists the average DNS object count across all IB-FLEX members in the Grid during the past five days. The DNS object count is calculated as the total DNS resource record count for all DNS zones with IB-FLEX member as the Grid primary. The data is generated once every 24 hours and the average is calculated over 5 days. This dashboard displays the following information in either line chart or table format:

- **Show Filters**: Click **Show Filters** to enable the filters.
- **Time**: Select a value from the drop-down list. The default value is **Last 6 days**.
- **Line Chart**: Click **Line Chart** to view the data in line chart format.
- **Table**: Click **Table** to view the data in table format.
- **Both**: Click **Both** to view the data in both line chart and table format.

**Device (Discovery) Dashboards**

**Inactive IP Addresses**

The **Inactive IP Addresses** dashboard lists inactive IP addresses that are not in use since the initial specified time, and remain so through the last discovery cycle. For example, you can use this dashboard to compare the state of all ports on devices for one month's operation versus 1 week's operation. The dashboard lists inactive IP addresses associated with Hosts, IPv4 and IPv6 Fixed Address objects, and IPv4 Reservation objects. Each unique IP address within each network view appears exactly once in the dashboard. You can go to the **Data Management → IPAM** page to delete listed inactive IP addresses.

By default, this dashboard operates for all devices across all network views. This dashboard supports use of a single time filter. You can filter by device name or network view.

This dashboard displays the following IP address and device information in table format:

- **IP**: The IP address.
- **Last MAC/DUID**: The discovered MAC or DUID.
- **Type**: Inactive IP address object type: Fixed Address, IPv4 Reservation or Host.
- **Device Type**: The type of device connected to the inactive IP address. Types include **Router**, **Firewall**, **Switch-Router**, and **Switch**.
- **Device Name**: The name of the device connected to the inactive IP address.
- **Port/Interface**: The device interface bound to the IP address.
- **Network View**: The network view containing the inactive IP address.

**Port Capacity Delta by Device**

The **Port Capacity Delta by Device** dashboard provides three Start/End time ranges by which each measured device illustrates how many interfaces move into and out of the three key functional states for each port: Administratively Up/Operationally Up, Administratively Up/Operationally Down and Administratively Down/Operationally Down.
For example, consider a port that is in the Administratively Up/Operationally Up status on a given device at the beginning of a one-week measurement (Start), and that it is the only port that changes state for that device in the measurement period. At the end of the measurement period (End) it goes into an Administratively Up/Operationally Down state. At first, the Administratively Up/Operationally Up Start counter reflects the discovered state at the beginning of the measurement period. When the port changes state, and its change is discovered, the Administratively Up/Operationally Up End counter decrements by 1; the Administratively Up/Operationally Down Start counter increases by 1. The data format is similar to the Port Capacity Utilization by Device report except that each data point divides into two values (Start and End), reflecting the delta.

You can filter by device name or network view, or both. This dashboard displays the following categories of information in table format:

- **Device Name**: Name of the listed device.
- **Admin Up, Operation Up Start**: count at the starting time of measurement of device interfaces in Admin Up/Operational Up status.
- **Admin Up, Operation Up End**: count at the ending time of measurement device interfaces in Admin Up/Operational Up status.
- **Admin Down, Operation Down Start**: count at the starting time of measurement of device interfaces in Admin Down/Operational Down status.
- **Admin Down, Operation Down End**: count at the ending time of device interfaces in Admin Down/Operational Down status.
- **Admin Up, Operation Down Start**: count at the starting time of measurement of device interfaces in Admin Up and Operational Down status.
- **Admin Up, Operation Down End**: count at the ending time of device interfaces in Admin Up and Operational Down status.
- **Total Available**: The total number of available ports for the listed device.
- **Network View**: The grid Manager Network View to which the device is associated.

**Port Capacity Trend**

The Port Capacity Trend report is a line graph of device port utilization over time. It uses the Administratively Up/Operationally Up, Administratively Up/Operationally Down, and Administratively Down/Operationally Down counters; by default, for all interfaces across all devices, across all network views, to produce a line chart illustrating four broad data categories:

- **Admin Up, Operation Up**: cumulative count over time of device interfaces in Admin Up/Operational Up status.
- **Admin Down, Operation Down**: cumulative count over time of device interfaces in Admin Down/Operational Down status.
- **Admin Up, Operation Down**: cumulative count over time of device interfaces in Admin Up and Operational Down status.
- **Total Available**: Total number of ports on all devices across all network views, whether provisioned or not.

The default time span for this trend chart is one week of measurement. You can filter by device name or network view, or both. You will need to know the device name or network view name for filter entry.

Should you turn off filtering, the dashboard shows the collected data "for all time;" for the entire period since monitoring began.

**Port Capacity Utilization by Device**

The Port Capacity Utilization by Device provides the devices' overall port status for the specified time, without stating devices' or individual ports' operating state. Each device's count of unused interfaces, within each network view, appears exactly once in the dashboard. By default, the table sorts by ascending Device Name. By default, this dashboard lists all devices, across all network views. You can filter by device name or network view, or both. Grid Manager takes snapshots of data for Port Capacity reports every six hours.

You will see three distinct port configuration combination counts per device:

- Administratively Up, Operationally Up
- Administratively Up, Operationally Down
- Administratively Down, Operationally Down

This dashboard displays the following information in table format:

- **Device Name**: The name of the device associated with the port status counts.
- **Admin Up, Operation Up**: The count of device interfaces in Admin Up/Operational Up status.
- **Admin Down, Operation Down**: The count of device interfaces in Admin Down/Operational Down status.
- **Admin Up, Operation Down**: The count of device interfaces in Admin Up and Operational Down status.
- **Total Available**: Total number of interfaces available for the device, whether provisioned or not.
- **Network View**: The network view containing the listed device.

**IP Address Inventory**

The IP Address Inventory dashboard provides information about all IP addresses that can be discovered by NetMRI (IPAM sync), vDiscovery, and Network Insight solutions. This dashboard displays the list of IP addresses, management platform, discovered name, and the details of the network devices that have been discovered.

The dashboard data can be filtered by Time, Network View, IP Address, Management Platform, First Seen and Last Seen timestamps. For instance, you can filter by Management Platform and see which platform the device possesses during the given time frame.

- **IP address**: The discovered IPv4 or IPv6 address.
- **Discovered Name**: The discovered name of the device.
- **First Seen**: The timestamp when the IP address was first seen in the network.
- **Last Seen**: The timestamp when the IP address was last seen in the network.
- **Network View**: The network view with which the IP address is associated.
- **Managed**: Indicates if the discovered device is managed by NIOS. For NIOS managed device, you can define basic characteristics and manage those devices on NIOS.
- **Management Platform**: The platform information from where IP address is discovered. This can be Network Insight, Amazon, OpenStack, or VMware.
- **VLAN Name**: The VLAN name on the switch port.
- **VLAN ID**: The VLAN ID on the switch port.

### Network Inventory

The **Network Inventory** dashboard provides information about all known networks. The dashboard displays the list of device IP addresses, IP address utilization%, management platform, and the netmask details of the devices that have been discovered. This dashboard displays a table that contains the following information:

- **Device IP Address**: The IP address of the device.
- **Netmask**: The netmask of the network.
- **First Seen**: The timestamp when the IP address was first seen in the network.
- **Last Seen**: The timestamp when the IP address was last seen in the network.
- **Network View**: The network view with which the device is associated.
- **Utilization%**: Displays the percentage based on the IP addresses that are currently in use on the network. For example, a /30 subnet mask can have two IP addresses that are in use. If both IP addresses are detected then the Utilization% is 100%.
- **Managed**: Indicates whether this network is a managed or unmanaged object in NIOS. Managed objects are configured for DNS or DHCP and have corresponding NIOS objects such as fixed addresses, DNS records, or host records, which you can manage directly in NIOS.
- **Management Platform**: The platform information from where IP address is discovered. This can be Network Insight, Amazon, OpenStack, or VMware.
- **VLAN ID**: The VLAN ID on the switch port.
- **VLAN Name**: The VLAN name on the switch port.

### Network Insight Dashboards

The Network Insight dashboards are available only when you have configured the Network Insight appliance as a Grid member with a valid Network Insight license installed. For information about Network Insight, see [Infoblox Network Insight](https://www.infoblox.com/products/network-insight).

### End Host History

The **End Host History** dashboard provides the history of the end hosts discovered by Network Insight in a given time frame across all network views. This dashboard is applicable only for the Network Insight solution. The dashboard displays the list of MAC addresses for end hosts, their IP addresses and the details of the network devices from which the end hosts have been discovered. The dashboard data can be filtered by Network View, MAC Address, IP Address, First Seen and Last Seen timestamps. For instance, you can filter by MAC address and see which IP address the end host possesses during the given time frame. You can also filter by the First Seen and/or Last Seen timestamp and find the MAC addresses of the end hosts becoming active and/or going offline. This dashboard displays the following information in table format:

- **MAC Address**: The MAC address of the end host.
- **IP address**: The IP address of the end host.
- **First Seen**: The timestamp when the MAC address was first seen in the network.
- **Last Seen**: The timestamp when the MAC address was last seen in the network.
- **Network View**: The network view with which the end host is associated.
- **Device Name**: The name of the network device that has the ARP (Address Resolution Protocol) of the end host.
- **Device Vendor**: The vendor of the network device that has the ARP of the end host.
- **Device Model**: The model of the network device that has the ARP of the end host.
- **Device OS Version**: The OS version of the network device that has the ARP of the end host.
- **Device Interface**: The interface name of the network device that has the ARP of the end host.
- **Device VLAN**: The VLAN ID of the interface that has the ARM (Asynchronous Response Mode) of the end host.
- **AP Name**: The name of the access point of the device. This column is displayed only for wireless devices.
- **AP IP Address**: The IP address of the access point of the device. This column is displayed only for wireless devices.
- **SSID**: The unique name of the WLAN (Wireless Local Area Network).
- **User Name**: The name of the user. This column is displayed only when the Identity Mapping feature on the appliance is enabled. For information about how to enable the Identity Mapping feature, see [Enabling Identity Mapping](https://www.infoblox.com/products/network-insight).

### Device Interface Inventory

The **Device Interface Inventory** dashboard provides interface statistics of devices discovered by Network Insight in a given time frame. This dashboard is applicable only for the Network Insight solution. The dashboard displays the list of interface IP addresses, device operating system, device model, discovered name, and the details of the network devices that have been discovered. This dashboard displays a table that contains the following information:
• **Network View**: The network view to which the device is associated.
• **Device IP Address**: The IP address of the network device.
• **Device Name**: The name of the network device.
• **Device Type**: The device type as discovered. This can be **Switch**, **Router**, or **Switch-Router**.
• **Device Vendor**: The vendor of the network device.
• **Device Model**: The model of the network device.
• **Device OS Version**: The OS version of the network device.
• **Interface Name**: The interface name of the network device.
• **Interface IP**: The IP address of the device interface.
• **Interface Description**: Additional information about the device interface.
• **Admin Status**: The switched interface's Admin status (whether the port is administratively enabled by the operator).
• **Operation Status**: The switched interface's operating status.
• **Last Port Changed**: The timestamp of the last change made on the interface (change can be anything such as changing the description, changing the VLAN, or changing the interface status to up or down).
• **Trunk Port**: Indicates if the interface is enabled for trunking (allows multiple VLANs). Displays **Yes** or **No**.
• **Type**: The standard interface type supported by the port.
• **Speed**: The line speed of each listed interface.
• **VLAN ID**: The VLAN ID on the switch port.
• **VLAN Name**: The VLAN name on the switch port.
• **Network**: The network address.

**Device Inventory**

The **Device Inventory** dashboard provides statistics of device inventory data discovered by Network Insight in a given time frame. This dashboard is applicable only for the Network Insight solution. The dashboard displays the list of interface IP addresses, device operating system, device model, discovered name, and the device details that have been discovered. This dashboard displays a table that contains the following information:

• **Device Type**: The device type as discovered. This can be **Switch**, **Router**, **Firewall**, **Load Balancer**, **Switch-Router** and so on.
• **Asset Type**: Indicates that the device is a physical device, virtual device, or host.
• **Device Vendor**: The vendor of the device.
• **Device Model**: The model of the device.
• **OS Version**: The version of the operating system that is running on the device.
• **Device Name**: The name of the device.
• **Chassis S/N**: Displays the hardware serial number. This displays multiple values if there are more than one chassis or modules installed on the hardware.
• **Device IP Address**: The IP address of the network device.
• **Network View**: The network view with which the device is associated.
• **First Seen**: The timestamp when the IP address was first seen in the network.
• **Last Seen**: The timestamp when the IP address was last seen in the network.

**Device Components**

The **Device Components** dashboard provides information about device components discovered by Network Insight. This dashboard is applicable only for the Network Insight solution. The dashboard displays the list of device IP addresses, device operating system version, device model, device vendor, discovered name, and the device model that have been discovered. This dashboard displays a table that contains the following information:

• **Device IP**: The IP address of the device.
• **Network View**: The network view with which the device is associated.
• **Device Name**: The name of the device.
• **Device Model**: The model of the device.
• **Device Vendor**: The vendor of the device.
• **OS Version**: The version of the operating system that is running on the device.
• **Name**: The name of the network component.
• **Description**: Additional information about the network component.
• **Class**: The device category.
• **S/N**: Displays the hardware serial number. This displays multiple values if there are more than one chassis or modules installed on the hardware.
• **Model**: The product name or model of the network device.
• **Hardware Rev**: The hardware version number of the device.
• **Firmware Rev**: The firmware version of the device.
• **Software Rev**: The software version of the device.

**IPAMv4 Device Networks**

The **IPAMv4 Device Networks** dashboard provides IPAMv4 device usage for each network in a given time frame. This dashboard displays the following information:
- **IPAM Network**: The network address.
- **Utilization %**: The percentage of IP address in use over the total number of IP addresses in the network.
- **Network View**: The network view.
- **Device IP**: The IP address of the device.
- **Device Name**: The name of the device.
- **Interface IP**: The IP address of the device interface.
- **Device Model**: The model of the device.
- **Device Vendor**: The vendor of the device.
- **Device OS Version**: The version of the operating system that is running on the device.

### DHCP Dashboards

#### Device Class Trend

The *Device Class Trend* dashboard provides trends for the top device classes used by remote clients in a given time frame. The default dashboard displays line graphs for the top device classes used by remote clients over the last 24 hours. Each of the device class is represented with a different color line graph.

#### Device Fingerprint Change Detected

The *Device Fingerprint Change Detected* dashboard provides information about the devices whose fingerprint data gets changed in a given time frame. In other words, this dashboard includes all devices used by remote clients that were detected to have the same Mac address but different device class in a given time frame. The following example illustrates how the fingerprint data can change in a given time frame:

A client device having dual boot option may request for an IP address while switching between operating systems, resulting in a change of fingerprint data and if a client's device uses Mac Boot Camp, the mac address remains unchanged, but fingerprint data changes when it switches operating system.

*Note*: The *Device Fingerprint Change Detected* report includes all devices whose fingerprint data has been changed within the last seven days. It ignores devices whose fingerprint data has been changed for more than seven days.

This dashboard displays a table that contains the following information:

- **Time**: The time the lease was obtained.
- **Mac/DUID**: The Mac address or DUID of the client's device.
- **Current Device Type**: The current fingerprint description of the device.
- **Current Device Class**: The current fingerprint class of the device.
- **Previous Device Type**: The fingerprint description of the device before changing the fingerprint data.
- **Previous Device Class**: The fingerprint class of the device before changing the fingerprint data.
- **Action**: The current status of the lease. The lease status can be one of the following: *Issued*, *Renewed*, *Freed*, or *Abandoned*.

#### Device Trend

The *Device Trend* dashboard provides trends for the top operating systems used by remote clients in a given time frame. The default dashboard displays line graphs for the top 10 operating systems used by remote clients over the last 24 hours. Each of the operating system is represented with a different color line graph. For more information about DHCP fingerprint detection, see *About DHCP Fingerprints*.

### DHCP Lease History

The *DHCP Lease History* dashboard provides DHCP lease history in a given time frame. The search of the DHCP Lease History report is scheduled hourly by default. DHCP Lease History reports can impose heavier system loads than for other alert types in the NIOS system. Avoid defining too many personal reports or alerts of this type for Grid reporting. Other types of reports do not impose significant performance restrictions. Also see *About IP Blocks and IP Block Groups* for methods to avoid this issue. You can drill down to the IP address of the lease and view user history for the selected IP address.

*Note*: When you join a new member to the Grid and do not start reporting service on the member, lease history for this member is not captured in the *DHCP Lease History* report. You can view lease history for this member in the *Data Management* tab -> *DHCP* tab -> *Leases* tab.

The default dashboard displays the following information in table format:

- **Time**: The timestamp when the lease information was updated.
- **Members**: The DHCP member that granted the lease.
- **Member IP**: The IP address of the DHCP member that granted the lease.
• **Lease IP**: The IP address of the lease. You can click the lease IP address to view login details of the user. For information about User History for Lease IP sub-report, see User History for Lease IP. You can also view subscription data for the selected lease IP. For information, see Subscription Data.

• **Protocol**: Indicates whether the lease is for an IPv4 or IPv6 address.

• **Action**: The status of the lease. This can be one of the following: Issued, Renewed, Freed, or Abandoned.

• **Hostname**: The host name that the DHCP client sent to the appliance using DHCP option 12.

• **MAC/DUID**: For an IPv4 address, this is the MAC address of the lease. For an IPv6 address, this is the DUID (DHCP Unique Identifier) of the DHCP client that received the lease.

• **Lease Time**: The lease time of the DHCP client.

**Note**: Some of the options in the Lease Time filter might not display any data.

• **Lease Start**: The start date of the lease.

• **Lease End**: The end date of the lease.

• **Fingerprint**: The name of the DHCP fingerprint or vendor ID of the leased client that was identified through DHCP fingerprint detection. This field displays No Match for devices that do not match the filter criteria and those that do not have any DHCP fingerprint information. For information about DHCP fingerprints, see About DHCP Fingerprints.

• **Component Name**: The name of the device.

• **Component Port**: The port or interface connected to the device.

• **Device Class**: Filter by the device category to which the leased client belongs.

**DHCP Message Rate Trend**

The **DHCP Message Rate Trend** dashboard provides the overall DHCP message rate trends for DHCP message types in a given time frame. The default dashboard displays the actual, maximum, average, and minimum rate trends in the last 24 hours for the following message types: DHCPDISCOVER, DHCPOFFER, DHCPREQUEST, and DHCPACK.

This dashboard displays the following information:

• **Time**: The timestamp of the event.

• **DHCPDISCOVER**: The actual rate trend of the DHCPDISCOVER messages.

• **DHCPOFFER**: The actual rate trend of the DHCPOFFER messages.

• **DHCPREQUEST**: The actual rate trend of the DHCPREQUEST messages.

• **DHCPACK**: The actual rate trend of the DHCPACK messages. Each of the line graphs is represented with a different color.

**DHCP Top Lease Clients**

The **DHCP Top Lease Clients** dashboard provides information about the DHCP clients that have issued, renewed, and freed within a certain time frame.

This dashboard shows the following information:

• **MAC/DUID**: The MAC address or DUID of the DHCP client.

• **Issued**: The total number of DHCP lease issued.

• **Renewed**: The number of DHCP lease renewals.

• **Freed**: The number of leases that were released.

• **MAC/DUID Total**: The total number of DHCP leases that were being requested, renewed, and released.

• **Fingerprint**: The name of the DHCP fingerprint or vendor ID of the leased client that was identified through DHCP fingerprint detection. This field displays No Match for devices that do not match the filter criteria and those that do not have any DHCP fingerprint information. For information about DHCP fingerprints, see About DHCP Fingerprints.

**DHCPv4 Range Utilization Trend**

The **DHCPv4 Range Utilization Trend** dashboard provides DHCP usage trends for the top five most utilized address ranges in a given time frame. The default dashboard includes the top five most utilized DHCP ranges among all network views, all members, all subnets, and all IPv4 addresses.

The default dashboard displays line graphs for the top five most utilized address ranges and shows their DHCPv4 usage trends over the last 24 hours. Each of the five address ranges is represented with a different color line graph.

**DHCPv4 Usage Statistics**

The **DHCPv4 Usage Statistics** dashboard provides the overall DHCPv4 usage in a given time frame. The default dashboard includes all network views, all members, all subnets, all IPv4 addresses, and all DHCP ranges, and the default time frame is the last hour. The table is sorted by DHCP utilization rate.

This dashboard displays the following information in table format:

• **Timestamps**: The date and time of the event.

• **Network View**: Filter by a specific network view.

• **Network**: The network address.
CIDR: The subnet mask in CIDR format.

AD Site: The Active Directory Site associated with the network. For networks that are not associated with Active Directory Domains and Sites, or when you delete an Active Directory server, the appliance displays **no_value** in this column.

DHCPv4 Utilization: The percentage of DHCP address in use over the total number of DHCP addresses provisioned.

Ranges: The total number of IP address ranges in the network.

Provisioned: The total number of DHCP addresses configured.

Dynamic: The number of dynamic DHCP leases issued.

Static: The number of static DHCP addresses configured.

Free: The number of free DHCP addresses.

Used: The total number of DHCP addresses in use.

**DHCPv4 Usage Trend**

The **DHCPv4 Usage Trend** dashboard provides the overall DHCP usage trend for all members in a given time frame. The default dashboard includes information about all DHCP ranges in all network views, all members, all subnets, and all IPv4 addresses. It displays line graphs for the dynamic, static, and free DHCPv4 leases and shows their DHCPv4 usage trends over the last 24 hours. Each of the DHCPv4 leases is represented with a different color line graph.

This dashboard displays the following information:

- **Time**: The timestamp of the event.
- **Dynamic**: The number of dynamic DHCP leases issued.
- **Static**: The number of static DHCP addresses configured.
- **Free**: The number of free DHCP addresses.

Each of the line graphs is represented with a different color. When you select more than one member as the filter criteria, the dashboard displays line graphs for each of the following data: Dynamic, Static, and Free, for each selected member.

**Microsoft Servers**: Specify Microsoft servers assigned to networks and DHCP ranges. This filter is available even if no MS Management license installed on GM and Grid members.

**Top Device Classes**

The **Top Device Classes** dashboard lists the top DHCP fingerprint device class for requesting clients. The default dashboard displays the top 10 device classes along with the percentage of leased devices within the last 24 hours. The appliance lists the top detected device class in table format. You can click a specific row in the table to view all the devices in the class that belong to the selected device class. GUI displays the fingerprints that are detected under a selected device class. The total number of fingerprints of a specific device class is equal to the total number that is displayed against the corresponding device class.

This dashboard displays a table that contains the following information for each top DHCP fingerprint device class:

- **Device Class**: The device category or fingerprint class for the requesting clients.
- **Total**: The total number of leased clients that belong to this DHCP fingerprint class.
- **% of all devices**: The percentage of the leased clients belonging to this DHCP fingerprint class over the total number of requesting clients.

**Top Devices Denied an IP Address**

The **Top Devices Denied an IP Address** dashboard lists the top DHCP fingerprint devices used by remote clients that were denied a lease or an IP address based on the fingerprint filter criteria you specified. The default dashboard displays the top 10 devices per combination of fingerprint and network which were denied an IP address within the last 24 hours. For example, if the same device is denied from two separate networks during the past 24 hours, and/or with different fingerprints, then multiple events will be listed in the table corresponding to this device.

This dashboard displays a table that contains the following information for each denied DHCP fingerprint device class:

- **Mac/DUID**: The Mac address or DUID of the client's device.
- **Fingerprint**: The fingerprint description of the device used by remote clients.
- **Device Class**: The DHCP fingerprint class of the device used by remote clients.
- **Network**: The network to which the DHCP range belongs. For shared network, the network is the first network where the lease is prohibited due to fingerprint filter.
- **Attempts**: The total number of attempts by remote clients for an IP address in a given time frame.
- **Last Attempt**: The time stamp of the last attempt by remote client for an IP address in a given time frame.

**Top Devices Identified**

The **Top Devices Identified** dashboard lists the top DHCP fingerprints or detected operating systems for requesting clients. The appliance uses DHCP fingerprint detection to identify the operating systems or vendor IDs of remote clients. For more information about DHCP fingerprint detection, see **DHCP Fingerprint Detection**. The default dashboard displays the top 10 operating systems on which requesting clients are running within the last 24 hours.

The appliance lists the top detected operating systems or vendor IDs in table format. This dashboard shows the total number of different MAC devices that have requested a lease. You can click a specific row in the table to view a list of leased clients that belong to the selected operating
system or device type. Grid Manager displays another report that specifies more detailed information, such as the leased IPs and MAC addresses for each device that matches the selected DHCP fingerprint. The lease history for a fingerprint shows all the lease events that occurred during the time period specified with the parent search (Top Devices Identified report). It represents the number of devices that use the MAC/DUID as the unique identifier. Note that a single MAC address may have several lease events that occur within the specified time range for the parent search. Hence, the total number of each fingerprint will not be equal to the lease history of a fingerprint.

**Note:** You can use all available filters for the parent *Top Devices Identified* report, but you can filter the detailed report using only the *Fingerprint* column.

This dashboard displays a table that contains the following information for each top DHCP fingerprint:

- **Fingerprint:** The name of the DHCP fingerprint or vendor ID for the requesting clients.
- **Total:** The total number of leased clients that belong to this DHCP fingerprint.
- **% of all devices:** The percentage of the leased clients belonging to this DHCP fingerprint over the total number of requesting clients.

### DNS Dashboards

#### DDNS Update Rate Trend

The *DDNS Update Rate Trend* dashboard provides information about the dynamic DNS (DDNS) updates that occur on the DNS service. The default dashboard shows a line graph that tracks the rate of DDNS updates (counts per second) by query type in the given time frame. This dashboard displays DDNS updates per second by the following query type: Success, Failure, Reject, and Prerequisite Reject. The time is displayed according to the time zone specified on the reporting server in UTC format. You can mouse over the graph to display the coordinates of any point in the graph.

#### DNS Cache Hit Rate Trend

The *DNS Cache Hit Rate Trend* dashboard provides information about the cache hit ratio of selected Grid members. The dashboard shows line graphs that track cache hit rates over a given time frame. Note that if you have one member with two DNS views and requests are sent to only one DNS view, the maximum hit rate is 50% (not 100%) for the member because one DNS view has 100% hit rate and the other has 0, and the average is 50%.

**Note:** The *DNS Cache Hit Ratio Trend* is the search associated with the *DNS Cache Hit Rate Trend* report.

#### DNS Daily Peak Hour Query Rate by Member

The *DNS Daily Peak Hour Query Rate by Member* dashboard shows the average or peak DNS Query rate at the busiest hour within a day. This dashboard will help you identify the load that is being carried by each DNS Server during busy hours. This dashboard can help you plan better for capacity and reduce the risk of overloading DNS devices.

This dashboard displays the following information:

- **Time:** Timestamp of events.
- **QPS:** Query per second. QPS is calculated with two steps: 1) find out the busiest hour (on the top of hours such as from 8:00am to 9:00am) by average hourly QPS, and 2) use that hour's max/avg QPS as they daily max/avg QPS.

#### DNS Domain Query Trend

The *DNS Domain Query Trend* dashboard shows the trend of DNS queries for specific domains. This dashboard displays the DNS query trends for queries generated from both the internal and external sources.

#### DNS Domain Queried by Client

The *DNS Domain Queried by Client* dashboard shows the DNS domains being queried by the client. This dashboard displays the DNS domains that are being queried from both the internal and external sources.

#### Top DNS Clients by Query Type

The *Top DNS Clients by Query Type* dashboard lists the top DNS resource records that have been queried per client. This dashboard displays the DNS records query trends for queries that originate from both the internal and external sources.

#### Top DNS Clients Querying MX Records
The Top DNS Clients Querying MX Records dashboard lists the top MX records that have been queried per client. This dashboard displays the MX records query trends for queries that originate from both the internal and external sources.

DNS Daily Query Rate by Member

The DNS Daily Query Rate by Member dashboard shows the trend of the average or maximum daily DNS Query rate by member. This dashboard can help you identify the average or maximum daily load that is being carried by each DNS Server. This dashboard can help you plan better for capacity and reduce the risk of overloading DNS devices.

This dashboard displays the following information:

- **Time**: Timestamp of events.
- **QPS**: Query per second. QPS is calculated by the max/avg of 24 hourly QPS data per day (between midnights).

DNS Query Rate by Query Type

The DNS Query Rate by Query Type dashboard shows the trend of DNS queries per second by DNS record type. This dashboard displays line graphs of DNS query trends for selected DNS record types over a given time frame.

DNS Query Trend per IP Block Group

The DNS Query Trend per IP Block Group dashboard provides trend of DNS query counts aggregated over time intervals for user-defined IP block groups.

This dashboard displays the following information in table format:

- **Time**: Timestamp of events.
- **Group**: Name of the IP block group.
- **Query Count**: Total queries made to the IP block group for a specific time interval.

DNS Replies Trend

The DNS Replies Trend dashboard provides information about DNS query trends by message types. The dashboard shows line graphs that track DNS query replies by message type over a given time frame.

This dashboard displays line graphs of DNS query replies by the following query type: Failure, NXDomain, NXRRset, Referral, Success, Refused, and Other.

DNS Response Latency Trend

The DNS Response Latency Trend dashboard provides DNS latency response times for all or selected cache servers. This dashboard shows line graphs of DNS latency response times for each server.

DNS Effective Peak Usage Trend for Flex Grid License

The DNS Effective Peak Usage Trend for Flex Grid License dashboard lists the average of peak DNS queries per second for all IB-FLEX members in the Grid. The peak DNS queries per second are calculated as the maximum per day of average queries per second.

This dashboard displays the following information in either line chart or table format:

- **Show Filters**: Click Show Filters to enable the filters.
- **Time**: Select a value from the drop-down list. The default value is Last 30 days.
- **Line Chart**: Click Line Chart to view the data in line chart format.
- **Table**: Click Table to view the data in table format.
- **Both**: Click Both to view the data in both line chart and table format.

DNS Scavenged Object Count Trend

The DNS Scavenged Object Count Trend displays the number of removed stale DNS records per zone or DNS view over time. The default dashboard displays a reclaimed records count for the top five zones with the biggest number of records reclaimed over the last day.

DNS Query Rate by Member

The DNS Query Rate by Member dashboard shows the trend of DNS queries for selected members. This dashboard displays line graphs of DNS query trends for the selected members over a given time frame.
DNS Top Clients

The **DNS Top Clients dashboard** lists clients that have the most DNS queries. The dashboard shows horizontal bar charts that list clients that have the most total counts of DNS requests and their percentages over a given time frame. The default dashboard displays the top 10 clients within the last 24 hours. Note that the DNS Top Client report is not NAT client aware and therefore this dashboard does not show information for NATed clients.

To generate data for DNS Response Latency Trend dashboard, the Grid member enabled for DNS service queries itself for PTR record 1.0.0.127.in-addr.arpa every minute. NIOS will not exclude such DNS queries and displays default client 127.0.0.1 in the DNS Top Clients report.

DNS Top Clients Per Domain

The **DNS Top Clients Per Domain dashboard** lists the clients that have the most DNS queries for specified domain names and their subdomains. The dashboard shows a horizontal bar chart that lists the clients that have the most total counts of DNS requests and their percentages over a given time frame. You can display the report data in bar chart form or in table form. The domain or domains are specified using filters. The default dashboard displays the top 10 clients within the last 24 hours.

You can define the domains for capture in the Grid Reporting Properties editor (Administration tab -> Reporting tab -> Grid Reporting Properties -> DNS tab -> Monitor queries made to the following domains check box).

DNS Top NXDOMAIN / NOERROR (no data)

The **DNS Top NXDOMAIN / NOERROR (no data)** dashboard shows the number of responses transmitted by the specified name server(s) indicating a client-specified non-existent domain name. This dashboard displays horizontal bar graphs of DNS query trends for the selected members over a given time frame.

- NXDOMAIN indicates that no records of any type existed for the query name;
- NOERROR (no-data) indicates that no data existed for the requested resource record type; other records may exist for the query name.

**Note:** The statistical data on the IB-4030 appliance may not be absolutely accurate if acceleration cache entries are reused after the TTL expiration for other data during a given report monitoring interval. The default interval is 10 minutes.

DNS Top Requested Domain Names

The **DNS Top Requested Domain Names** dashboard lists the top most requested domain names, their counts and the percentage of request over a given time frame. The dashboard shows horizontal bar charts that list the total counts and request percentage for the top most requested domain names. The default dashboard displays the top 10 domain names within the last 24 hours.

**Note:** The statistical data on the IB-4030 appliance may not be absolutely accurate if acceleration cache entries are reused after the TTL expiration for other data during a given report monitoring interval. The default interval is 10 minutes.

DNS Top SERVFAIL Errors Sent

The **DNS Top SERVFAIL Errors Sent** dashboard lists the top query names resulting in Infoblox name servers sending DNS response packets containing the SERVFAIL message, to downstream clients. The length of the list of top queries, the time period for the report, and other parameters are specified using filters. The default dashboard displays the top 10 query names within the last 24 hours. When capturing queries, the Grid member matches authoritative and recursive queries to generate events for the report. This dashboard displays no DNS client information, or the identities of impacted name servers, when the SERVFAIL originates from an upstream server.

DNS Top SERVFAIL Errors Received

The **DNS Top SERVFAIL Errors Received** dashboard lists the top queries resulting in Infoblox name servers receiving DNS response packets containing the SERVFAIL message from upstream name servers. The length of the list of top queries, the time period for the report, and other parameters are specified using filters. The default dashboard displays the top upstream query names within the last 24 hours. (The upstream query name may be a query name supplied by a client, or another name that is needed while processing a client query.) When capturing queries, the Grid member matches recursive queries to generate events for the report. This dashboard displays no DNS client information, or the identities of impacted name servers. This dashboard reflects the exact numeric value of the number of queries.

DNS Top Timed-out Recursive Queries

The **DNS Top Timed-out Recursive Queries** dashboard shows the number of queries sent to Infoblox Grid member name servers, that result in timeouts after sending recursive queries to upstream name servers. This dashboard displays horizontal bar graphs of DNS query trends for the selected members over a given time frame.
DNS Traffic Control Resource Availability Status

The **DNS Traffic Control Resource Availability Status** dashboard provides the percentage of specific DNS Traffic Control resources that are available, partially available or unavailable over time. You can mouse over the pie chart to display the coordinates of any point in the pie chart. You can also drill down to view detailed data in table format.

This dashboard displays the following information:

- **Available**: Indicates if the resource is always available. When the availability of a resource is 100%, only then it is displayed as always available.
- **Partially Available**: Indicates if the resource is available sometimes. When the availability is less than 100% or more than 0%, only then it is displayed as partially available.
- **Unavailable**: Indicates if the resource is never available. When the availability is 0%, only then it is displayed as never available.

DNS Traffic Control Resource Availability Trend

The **DNS Traffic Control Resource Availability Trend** dashboard provides percentage of available DNS Traffic Control resources per server/health monitor pair over a period of time. You can aggregate data based on supported filtering categories and extensible attributes defined in the filtering feature.

The appliance aggregates data at every 10 minutes interval. You can mouse over the graph to display the coordinates of any point in the graph.

This dashboard displays the following information in either the line chart or table format:

- **Date and Time**: Timestamp of events.
- **Availability%**: Percentage of resources that are available.

DNS Traffic Control Resource Pool Availability Trend

The **DNS Traffic Control Resource Pool Availability Trend** dashboard provides information about the availability of load balanced resources that are grouped by extensible attributes over a selected period of time. The appliance aggregates data at every 10 minutes interval. You can mouse over the graph to display the coordinates of any point in the graph.

This dashboard displays the following information in either a line chart or a table format:

- **Time**: Timestamp of events.
- **Resource Pool**: The resource pools that are available.
- **Availability%**: The percentage of resource pools that are available.

DNS Traffic Control Resource Pool Availability Status

The **DNS Traffic Control Resource Pool Availability Status** dashboard provides information about the resource pools that are available, partially available, or unavailable at a certain time.

This dashboard displays the following information in a pie chart format:

- **Available**: Indicates if the resource pool is always available. When the availability of a resource pool is 100%, only then it is displayed as always available.
- **Partially Available**: Indicates if the resource pool is available sometimes. When the availability of a resource pool is less than 100% or more than 0%, only then it is displayed as partially available.
- **Unavailable**: Indicates if the resource pool is never available. When the availability of a resource pool is 0%, only then it is displayed as never available.

DNS Traffic Control Response Distribution Trend

The **DNS Traffic Control Response Distribution Trend** dashboard provides information about the number of responses returned by each resource. You can either group the results based on the resources in the pool, or by all resources with the associated same extensible attribute over a period of time. You can view how clients are load balanced or directed among different resources.

You can group the number of responses returned from each resource based on the pools. When you select **Resource Pool**, the appliance displays aggregated responses from resources belonging to a pool.

This dashboard displays the following information in either a line chart or a table format:

- **Time**: Timestamp of events.
- **Resource**: The resources that are available.
- **Responses**: The number of responses returned by each resource.

Security

**FireEye Alerts**
The FireEye Alerts dashboard lists the FireEye alerts that are received by the NIOS appliance. The dashboard displays the date and time when the alert was generated, mitigation action for the alert, ruleset specified for the blocked domain or IP address, and the name of the FireEye appliance that generated the alert. For more information about FireEye integrated RPZs, see Configuring FireEye RPZs.

Note: To enable this dashboard, you must select the Security check box in the Grid Reporting Properties editor. To select the check boxes, go to the Administration tab -> Reporting tab -> Grid Reporting Properties -> General tab -> Basic tab -> select the check box Security under Report Category. Note that you can receive this dashboard only on the Grid Master, not on Grid members, even if you have selected Security as a report category on the members.

This dashboard displays the following information in table format:

- **Time**: The date and time when the alert was generated.
- **AlertID**: The alert type along with the alert ID.
- **LogSeverity**: The severity of the alert, which can be Critical, Major, or Minor.
- **AlertType**: The type of alert received from the FireEye appliance.
- **FireEyeAppliance**: The FireEye appliance that generated the alert.
- **RPZEntry**: The RPZ rule specified for the FireEye alert.
- **MitigationAction**: The ruleset specified for the blocked domain name or IP address.

**DNS Top RPZ Hits**

The DNS Top RPZ Hits dashboard lists the top clients who received re-written responses through RPZ. The dashboard displays the total client hits and total rule hits over a given time frame. You can choose to view either the aggregated RPZ hits report or a detailed report of the top RPZ hits. In the Show filter, select Details to view the detailed report or select Aggregated Hits Count to view the aggregated report. When you select the Aggregated Hits Count option, the report data is consolidated based on the client ID, domain name, RPZ entry, RPZ severity, and mitigation action.

The appliance lists the top RPZ hits in table format. You can click a specific row in the table or the Client ID to view the DHCP lease history of a client. For information about DHCP lease history, see DHCP Lease History. Grid Manager displays another report that specifies more detailed information, such as the leased IPs, host name, and MAC addresses for each client. For more information about RPZs, see About Infoblox DNS Firewall. You can click Domain Name or RPZ Entry to view threat details of an RPZ rule. In addition, you can click the client IP address to view login details of the user. For information, see User History for IP Address.

You can compare the domain name and mitigation action in this dashboard with the RPZ rules and mitigation actions in the FireEye Alerts report to determine the RPZ hits received due to FireEye alerts.

Note: To enable this dashboard, you must select the DNS Query and Security check boxes in the Grid Reporting Properties editor. To select the check boxes, to the Administration tab -> Reporting tab -> Grid Reporting Properties -> General tab -> Basic tab -> select the check boxes DNS Query and Security under Report Category.

This dashboard displays the following information in table format:

- **Client ID**: The IP address of the client that queried the domain name that is listed in the RPZ ruleset.
- **Total Client Hits**: The total number of hits received for each DNS view from the respective client.
- **Domain Name**: The domain name that was queried.
- **Severity**: The threat severity level of an RPZ zone associated with the RPZ rule that was triggered.
- **RPZ Entry**: The RPZ rule that was triggered based on client queries.
- **Total Rule Hits**: The total number of hits received for a specific RPZ rule.
- **Mitigation Action**: The ruleset specified for the blocked domain name or IP address.
- **Substitute Addresses**: The address which was substituted for the blocked domain.
- **Time**: The date and time when the last hit was received. This information is displayed only in the detailed DNS Top RPZ Hits report.

The sub-dashboard Threat Details displays the following information in table format:

Note: Make sure that DNS resolution is enabled and running properly on the reporting member to view Threat Details.

- **RPZ Rule**: The RPZ rule that was triggered based on client queries.
- **First Identified**: The date and timestamp of the first occasion that the threat was detected.
- **Last Seen**: The date and timestamp of the last occasion that the threat was detected.
- **Threat Category**: The category to which the threat belongs.
- **Danger Level**: The severity level of the threat.
- **Short Description**: The brief description of an RPZ rule.
- **Description**: The detailed description of an RPZ rule.

**User History for IP Address**

The User History for IP Address sub-dashboard displays the login details of the active users associated with the IP address of the client. The default displays the following information in table format:

---

Copyright ©2019, Infoblox, Inc. All right reserved.
**User History for Lease IP**

You can view user information associated with the lease IP address. The default **User History for Lease IP** sub-dashboard displays the following information in table format:

- **Last Updated**: Displays the timestamp when the user information was last updated.
- **User Name**: The logon name of the user.
- **Domain**: The Active Directory domain name.
- **IP Address**: The IP address of the client.
- **First Seen**: The timestamp when the user logged in to the domain for the first time.
- **Logout Time**: The log out time of the user. This column displays NA when users are still active on the system.
- **Last Seen**: The timestamp when the user was last seen accessing a domain.
- **User Status**: Displays the status of the user. This can be one of the following: **Active** (logged in), **Logged Out**, **Timed Out**.
  - **Active**: The user is logged in and active.
  - **Logged Out**: The user has logged out of the system.
  - **Timed Out**: The user is logged in but has been idled for a certain period of time. The default is two hours. You can configure this time interval, as described in *Configuring Active User Timeout Session*.

**DNS Top RPZ Hits by Clients**

The **DNS Top RPZ Hits by Clients** dashboard lists the total number of RPZ hits from a client during an interval, irrespective of the rules and mitigation actions. You can view the IP address of the client, total hits and the date and time during which the hits were received.

The appliance lists the top RPZ hits by clients in table format. You can click a specific row in the table to view the lease history of a client. Grid Manager displays another report that specifies more detailed information, such as the leased IPs, host name, and MAC addresses for each client.

For more information about RPZs, see *About Infoblox DNS Firewall*. In addition, you can click the client IP address to view login details of the user. For information, see *User History for IP Address*.

This dashboard displays the following information in table format:

- **Client ID**: The IP address of the client that queried the domain name that is listed in the RPZ ruleset.
- **Total Client Hits**: The total number of hits received for all DNS view from the respective client.
- **Time**: The date and time when the last hit was received.

**Top DNS Firewall Hits**

The **Top DNS Firewall Hits** dashboard lists the top RPZ rules triggered over a given time frame. This dashboard lists information such as RPZ rule, percentage of RPZ rule hits, number of hits per RPZ rule, and the description of the threat that triggered the RPZ rule. The default dashboard displays the top 10 RPZ rules triggered within the last week.

*Note*: To enable this dashboard, you must select the DNS Query and Security check boxes in the Grid Reporting Properties editor. To select the check boxes, go to the Reporting tab -> Grid Reporting Properties -> General tab -> Basic tab, and then select the check boxes DNS Query and Security under Report Category.

The dashboard displays the following information in table format:

- **RPZ Rule**: The RPZ rule that was triggered based on client queries.
- **Percentage**: The percentage based on the number of hits for the RPZ rule divided by the total number of hits for the top RPZ rules.
- **# Hits**: The total number of hits received for the RPZ rule.
- **Description**: The detailed description of the threat that triggered the RPZ rule.

**DNS RPZ Hits Trend By Mitigation Action**

The **RPZ Hit Trend by Mitigation Action** dashboard provides trends for the total number of RPZ hits for each mitigation action along with the total client hits in a given time frame. You can view this report in either a line chart, a stacked chart, or in table format. You can choose to display the
The date and time when the last hit was received.

- **Time:** The date and time when the last hit was received.
- **Block:** Total number of queries that triggered a **Block (No Data)** and **Block (No Such Domain)** RPZ rule. For information about **Block (No Data)** and **Block (No Such Domain)** RPZ rules, see Managing Block (No Data) Rules and Managing Block (No Such Domain) Rules respectively.
- **Passthru:** Total number of queries that triggered the **Passthru** RPZ rule. For information about **Passthru** RPZ rule, see Managing Passthru Rules.
- **Substitute:** Total number of queries that triggered the **Substitute (Domain Name)** and **Substitute (Record)** RPZ rule. For information about **Substitute (Domain Name)** and **Substitute (Record)** RPZ rules, see Managing Substitute (Domain Name) Rules and Managing Substitute (Record) Rules respectively.
- **Client Hits:** Total number of queries that triggered an RPZ policy. The client hits is the sum of **Block (No Data)**, **Block (No Such Domain)**, **Passthru**, **Substitute (Domain Name)**, and **Substitute (Record)** RPZ hits. Note that this data is not displayed in the **Stacked Chart**, but displayed in the **Line Chart** and in **Table** format.

### Malicious Activity by Client

The **Malicious Activity By Client** dashboard lists the clients that have the most malicious activities. The default dashboard shows a bar chart that lists clients that have the most total counts of malicious activities that triggered the RPZ rule over the given time frame. The default dashboard displays the top 10 clients within the last week.

**Note:** To enable this dashboard, you must select the DNS Query and Security check boxes in the Grid Reporting Properties editor. To select the check boxes, go to the **Administration** tab -> Reporting tab -> Grid Reporting Properties -> General tab -> Basic tab, and then select the check boxes DNS Query and Security under Report Category.

This dashboard displays the following information:

- **Client ID:** The IP address of the client that queried the malicious domains.
- **# Hits:** The total number of RPZ hits by the client.
- **Domains:** The top three malicious domains queried by the client.
- **Last Active:** The timestamp of the last attempt when the client queried a malicious domain.

### DNS Firewall Executive Threat

The **DNS Firewall Executive Threat** dashboard is a predefined custom dashboard which consists of the following sub-dashboards:

- **Top DNS Firewall Hits**
- **Malicious Activity by Client**

**Note:** To enable this dashboard, you must select the DNS Query and Security check boxes in the Grid Reporting Properties editor. To select the check boxes, go to the **Administration** tab -> Reporting tab -> Grid Reporting Properties -> General tab -> Basic tab, and then select the check boxes DNS Query and Security under Report Category.

Note that you have to use the filters for each of the sub-reports to get specific information. You can also click **Download PDF** from the Toolbar to download the **DNS Firewall Executive Threat dashboard** in PDF format which includes the three-panel report in a single PDF.

### Threat Protection Event Count By Severity Trend

The **Threat Protection Event Count By Severity Trend** dashboard provides event count trends by severity in a given time frame. You can view event counts distributed for the following severity levels: Critical, Major, Warning and Informational. Each of the severity level of an event is represented with a different color.

You can also define alerts in this dashboard to notify administrators when a trend reaches a specified threshold. For information about how to define alerts, see **About IP Blocks and IP Block Groups**. When you configure alerts for this dashboard and define a threshold value to trigger SNMP traps for a specified reporting event type, the appliance triggers an alert every five minutes based on the filters you select. For information about how to trigger SNMP traps for reporting event types, see **Defining Thresholds for Traps**.

### Threat Protection Event Count By Member Trend

The **Threat Protection Event Count By Member Trend** dashboard provides event count trends on members that supports Advanced DNS Protection in a given time frame. This dashboard tracks events on a member over a given time frame. The default dashboard displays line chart that show events trends over the last day on the selected member. The default dashboard displays the top 5 appliances in descending order.
Threat Protection Event Count By Rule

The Threat Protection Event Count By Rule dashboard displays event counts based on violations of individual rules. The appliance displays event count by rule in table format and sorts the records by Total Event Count in descending order. You can click a specific Security ID in the table to view sub-report for the individual rule, showing aggregate event instances with timestamps for a specific rule on all members.

This dashboard displays the following information in table format:

- **SID**: The unique rule ID.
- **Category**: The category to which the rule belongs.
- **Log Severity**: The severity of an event, which can be **Critical**, **Major**, **Warning**, or **Informational**.
- **Event Name**: The name and description of the rule.
- **Alert Count**: The alert count of an event.
- **Drop Count**: The drop count of an event.
- **Total Event Count**: The total number of event counts triggered by a match against the rule.

The sub-dashboard Threat Protection Event Count for Rule displays the following information in table format:

**Note**: The sub-report Threat Protection Event Count for Rule displays all the detected events for a specific SID on all members, regardless of the filters you apply to the parent Threat Protection Event Count By Rule report.

- **Time**: The timestamp of an event.
- **SID**: The unique rule ID.
- **Member**: The name of the member that supports threat protection.
- **Category**: The category to which the rule belongs.
- **Log Severity**: The severity of an event, which can be **Critical**, **Major**, **Warning**, or **Informational**.
- **Event Name**: The name of a rule.
- **Alert Count**: The alert count of an event.
- **Drop Count**: The drop count of an event.
- **Total Event Count**: The total number of event counts triggered by a match against the rule.

Threat Protection Event Count By Time

The Threat Protection Event Count By Time dashboard displays event counts with timestamp in table format. This dashboard help you track security events behavior based on time of occurrence. For example, this dashboard indicates whether security events peak at specific times or if it has steadily increase over time.

This dashboard displays the following information in table format:

- **Time**: The timestamp of an event.
- **SID**: The unique rule ID.
- **Member**: The name of the member that supports threat protection.
- **Category**: The category to which the rule belongs.
- **Log Severity**: The severity of an event, which can be **Critical**, **Major**, **Warning**, or **Informational**.
- **Event Name**: The name and description of the rule.
- **Alert Count**: The alert count of an event.
- **Drop Count**: The drop count of an event.
- **Total Event Count**: The total number of event counts of a rule.

Threat Protection Event Count By Category

The Threat Protection Event Count By Category dashboard provides event counts by rule category. You can track rule categories that are under the most pressure from adverse events. This dashboard displays event counts in table format.

This dashboard displays the following information in table format:

- **Category**: The category to which a rule belongs.
- **Critical Event Count**: The number of critical events in the selected rule category.
- **Major Event Count**: The number of major events.
- **Warning Event Count**: The number of warning events.
- **Informational Event Count**: The number of informational events.
- **Total Event Count**: The total number of event counts triggered against a rule category.

Threat Protection Event Count By Member

The Threat Protection Event Count By Member dashboard provides event counts aggregated over time intervals for each member. This dashboard displays event count for each member in table format and sorts the records by Total Event Count in descending order.

This dashboard displays the following information in table format:

- **Member**: The name of the member that supports threat protection.
- **Critical Event Count**: The number of critical events on a member.
- **Major Event Count**: The number of major events detected on a member.
• **Warning Event Count:** The number of warning events detected on a member.
• **Informational Event Count:** The number of informational events detected on a member.
• **Total Event Count:** The total number of event counts detected on a member.

**Threat Protection Top Rules Logged**

The *Threat Protection Top Rules Logged* dashboard provides the list of the top 10 threat protection rules that are triggered by a source IP in a given time frame. You can also view the threat protection rules triggered by NAT'ed clients in a given time frame. You can view the source IP address, total number of events, rule name, and timestamp of the last event. If a rule is triggered by a NAT'ed client, then you can view the source IP address along with the port block of the NAT'ed client. You can also configure the appliance to display the report data in bar chart or in table form. The default dashboard displays bar chart for the top 10 rules that are triggered within the last seven days. This dashboard allows you to identify the IP address of a client and the rules it triggered.

**Note:** You can configure the top number of source IP addresses and threat protection rules on the appliance. For information about how to configure threat protection data, see *Configuring Threat Protection Data* on page 157.

This dashboard displays the following information in table format:

- **Rule:** The name and description of a rule that is triggered by the source IP. For each threat protection rule, the active count is displayed for the top three source IP addresses.
- **Logged Event Count:** The total number of events triggered against the rule.
- **Top Sources:** The IP address of the top sources triggering this rule. By default, the top 3 source IPs are displayed.
- **Last Active:** The timestamp when the rule was last active.

**Threat Protection Top Rules Logged by Source**

The *Threat Protection Top Rules Logged by Source* dashboard provides statistics about the total number of events triggered by the top sources (by client IP addresses) in a given time frame. You can also view the statistics for the total number of events triggered by NAT'ed clients in a given time frame. For example, if you configure a range of ports for a NAT'ed client, and if there are events logged from different port blocks of the NAT'ed client, then each port block is considered as a logical client in the dashboard. You can view the source IP address, total number of events, rule name, and timestamp of an event. If an event is triggered by a NAT'ed client, then you can view the source IP address along with the port block of the NAT'ed client. The default dashboard displays a bar chart for the top 10 source IPs that triggered threat protection rules within the last seven days. This dashboard allows you to identify the IP address of the client and the rules it triggered.

**Note:** You can configure the top number of source IP addresses and threat protection rules on the appliance. For information about how to configure threat protection data, see *Configuring Threat Protection Data*.

This dashboard displays the following information in table format:

- **Source:** The IP address of a source that triggered a threat protection rule.
- **Logged Event Count:** The total number of events triggered by a source against the rule.
- **Top Rules:** The name of the top rules triggered by each source IP. By default, the top three rules are displayed.
- **Last Active:** The timestamp when the source was last active.

**DNS Top Tunneling Activity**

The *DNS Top Tunneling Activity* dashboard lists the clients that have the most number of DNS tunneling activities in a given time frame. The default dashboard shows a horizontal bar chart that lists clients that have the most total counts of DNS tunneling events and their percentages over the given time frame. You can also configure the appliance to display this dashboard in table format. The default dashboard displays the top 10 clients within the last week. You can click the client IP address in the table or click the bar in the bar chart to view a sub-report *Rule hits for Client IP* for a specific client.

This dashboard displays the following information:

- **Client IP:** The source IP address that triggered the DNS tunneling event.
- **Event Count:** The total number of DNS tunneling events triggered by the client.

The sub-dashboard *Rule hits for Client IP* lists the number of events triggered by the selected client for each DNS tunneling category. It displays the following information in table format:

- **Category:** The category to which the DNS tunneling activity belongs. Category can include the type of DNS tunneling activities as well as tunneling tools used to generate the activities. A category can be *short TTL*, *NXDomain*, *high-entropy domains*, *Iodine tool*, and others.
- **Event Count:** The number of events triggered in each DNS tunneling category.
- **Last Seen:** The timestamp when the client was last active.

**DNS Tunneling Traffic by Category**
The **DNS Tunneling Traffic by Category** dashboard provides information about DNS tunneling activities by specific categories and the percentage of events by the category of DNS tunneling events in a given time frame. This dashboard helps you track abnormal DNS traffic. The default dashboard shows a pie chart that lists the categories of DNS tunneling events. You can mouse over the pie in the chart to view the DNS tunneling category, event counts, and their percentages. You can also configure the appliance to display this dashboard in table format. The default dashboard displays the top 10 DNS tunneling categories within the last week. You can click the category in the table or in the pie chart to view the sub-dashboard **DNS Top Tunneling Activity** dashboard for the selected category. For more information, see **DNS Top Tunneling Activity**. This dashboard displays the following information in table format:

- **Category**: The percentage based on the number of events in each DNS tunneling category divided by the total number of events in all the DNS tunneling categories.
- **Description**: The description about the rule that was triggered based on the client queries.

The sub-dashboard **DNS Top Tunneling Activity** dashboard displays the following information in table format:

- **Client IP**: The IP address of the client that triggered the DNS tunneling event.
- **Rule SID**: This field displays the rule ID for ADP rule hits. If you select **Detected by Analytics Engine** as the category, this field displays the name of the RPZ used for blacklisted domains detected through the analytics service.
- **Total DNS Tunneling Events**: The total number of DNS tunneling events triggered by the respective client.
- **Total Outbound malicious queries**: The total number of RPZ hits received from the respective client.
- **Last Seen**: The timestamp when the client was last active.

### Top Malware and DNS Tunneling Events by Client

The **Top Malware and DNS Tunneling Events by Client** dashboard lists the clients that have the most number of outbound malicious queries (RPZ hits) and DNS tunneling events in a given time frame. This dashboard lists the IP address of the client, total number of outbound malicious queries, total number of DNS tunneling events, and the timestamp when the client was last active. The appliance displays the report data in table format. You can click the client IP in the table to view the sub-report **Security Info for Client IP** for a specific client. This dashboard displays the following information in table format:

- **Client IP**: The IP address of the client that triggered the most number of outbound malicious queries (RPZ hits) and DNS tunneling events.
- **Total DNS Tunneling Events**: The total number of DNS tunneling events triggered by the respective client.
- **Total Outbound malicious queries**: The total number of RPZ hits received from the respective client.
- **Last Seen**: The timestamp when the client was last active.

The sub-dashboard **Security Info for Client IP** includes the DHCP and IP address management data along with the RPZ and DNS tunneling activities for the selected client. It displays the following information in table format:

- **Host Name**: The host name of the DHCP client.
- **MAC/DUID**: The MAC address or the DUID of the client.
- **Lease Start - Lease End**: The start and end date of the lease.
- **Fingerprint**: The DHCP fingerprint information of the client device.
- **Top 3 RPZ rules**: The top three RPZ rules triggered based on the queries from the selected client.
- **Top 3 DNS tunneling events**: The top three DNS tunneling events triggered by the selected client.
- **Device Name**: The name of the client device.
- **Port/Interface**: The name of the port or interface connected to the client device.

### Cloud Dashboard

#### VM Address History

The **VM Address History** dashboard provides VM address history in a given time frame. This dashboard is applicable only for the Cloud Network Automation solution. You can generate this dashboard to view activities over time for specific VM interfaces in the cloud environment. This dashboard lists information such as IP address, Action, MAC address, Port ID, FQDN, VM Name, Network, Tenant ID, and other fields associated with the VM interfaces. You can click a specific row in the table to view the **DHCP Lease History** dashboard for the VM. Grid Manager displays the **DHCP Lease History** dashboard below the **VM Address History** dashboard.

### Ecosystem Dashboards

#### User Login History Report

The **User Login History** dashboard provides information about user login activities in a given time frame. You can use this dashboard to audit user logins. This dashboard allows you to identify the IP address of a client, domains used by a user to login, the number of active users, and the login...
activities of a user over a period of time. This dashboard displays the following information in table format:

- **Last Updated**: Displays the timestamp when the user information was last synchronized with the Microsoft server.
- **User Name**: The logon name of the user.
- **Domain**: The Active Directory domain name.
- **IP Address**: The IP address of the client.
- **First Seen**: The timestamp when the user logged in to the Active Directory domain for the first time.
- **Logout Time**: The log out time of the user. This column displays NA when users are active on the Microsoft server.
- **Last Seen**: The timestamp when the user was last seen accessing an Active Directory domain.
- **User Status**: Displays the status of the user. This can be one of the following: **Active** (logged in), **Logged Out**, **Timed Out**.
  - **Active**: The user is logged in and active.
  - **Logged Out**: The user has logged out of the system.
  - **Timed Out**: The user is logged in but has been idled for a certain period of time. The default is two hours. You can configure this time interval, as described in Configuring Active User Timeout Session.

**Subscription Data**

The Subscription Data dashboard displays the user and device identity captured by the Cisco ISE for the subscribed member. The default dashboard displays user name, domain name, VLAN ID, Device operating system, and last discovered timestamp.

The predefined Subscription Data dashboard displays the following information:

- **User Name**: The logon name of the user.
- **Domain**: The domain name.
- **SSID**: Provision SSID. This is for corporate devices that connect to the corporate wireless SSID.
- **VLAN Name**: The name of the VLAN of the switch port.
- **VLAN ID**: The ID of the VLAN of the switch port.
- **Device OS**: Operating system of the device.
- **Session State**: The current status of the device.
- **Security Group**: Unique security group tag.
- **Discovered At**: Timestamp when the device was discovered.
- **Quarantine Status**: Indicates if the device should be quarantined or not.
- **IP Address**: The IP address of the client.
- **Grid ID**: The IP address of the subscribed member.

**Publish Data**

The Publish Data dashboard displays the RPZ, Security ADP, IPAM and DHCP lease information that is shared with the Cisco ISE. The default Publish Data dashboard displays the following information:

- **Last Updated**: Timestamp when the data was last updated for the device.
- **IP Address**: The source IP address that is publishing the data.
- **Target Address**: The IP address of the target Cisco ISE.
- **Publish Type**: The event type that is published.
- **Contents**: Additional details of the published information.

**System Utilization Dashboards**

**CPU Utilization Trend**

The CPU Utilization Trend dashboard provides CPU usage trends over a given time frame. The default dashboard displays line graphs that show CPU usage trends for up to five members in the Grid over the last 24 hours. Each of the members is represented with a different color line graph.

**Memory Utilization Trend**

The Memory Utilization Trend dashboard provides memory usage trends over a given time frame. The default dashboard displays line graphs that show memory usage trends for up to five members in the Grid over the last 24 hours. Each of the members is represented with a different color line graph.

**Traffic Rate by Member**

The Traffic Rate by Member dashboard provides inbound and outbound traffic over a given time frame. The dashboard displays line graphs that show traffic rate for members with reporting service enabled within the last 24 hours. Grid Manager uses different color line graphs to distinguish inbound and outbound traffic for different members.
Flex Grid Licensing Features Enabled

The Flex Grid Licensing Features Enabled dashboard lists the overall status of licensed features across all IB-FLEX members in the Grid. You can also view the status of each feature for individual members during a specified time period.

**Note:** When you move your mouse away from the FLEX Grid Licensing Features Enabled section, the Open in Search, Inspect, and Refresh icons might not show up in the GUI. You can view these icons when you move your mouse on the data displayed for the FLEX Grid Licensing Features Enabled dashboard.

This dashboard displays the following information in table format:

- **Feature:** Indicates the features on which the Flex Grid Activation license is installed.
  - **Active Trust Plus:** Displays Active Trust Plus as enabled on a member when any of the following RPZ feed zones are configured: antimalware-ip.rpz.infoblox.local, bot-ip.rpz.infoblox.local, exploitkit-ip.rpz.infoblox.local, malware-dga.rpz.infoblox.local, tor-exit-node-ip.rpz.infoblox.local, multi-domain.surbl.rpz.infoblox.local, and fresh-domain.surbl.rpz.infoblox.local.
  - **Active Trust Standard:** Displays Active Trust Standard as enabled on a member when any of the following RPZ feed zones are configured: base.rpz.infoblox.local, antimalware.rpz.infoblox.local, ransomware.rpz.infoblox.local, and bogon.rpz.infoblox.local.

**Note:** Active Trust Standard supports four zones whereas Active Trust Plus or Active Trust Advanced supports four zones and additional seven zones. This report displays the highest level of Active Trust support that is configured for a member.

- **Authoritative DNS:** Displays if DNS is enabled and authoritative zone is assigned to the member.
- **DNS Cache Acceleration:** Displays if DNS Cache Acceleration service is enabled on a member.
- **DNS Traffic Control:** Displays if DNS is enabled with resolver set to DNS server and the LBDN pool is configured for DNS Traffic Control.
- **FireEye:** Displays if DNS is enabled and FireEye zone is configured on a member.
- **Recursive DNS:** Displays information about whether DNS and recursion are enabled at the following levels:
  - Recursion is enabled at the member level.
  - Recursion is enabled at the Grid level and member inherits the setting.
  - Recursion is enabled for any DNS view assigned to a member.
- **Security Ecosystem:** Displays if TAXII is enabled on a member.
- **Threat Analytics:** Displays if Threat Analytics is enabled on a member.
- **Threat Protection:** Displays if Threat Protection service is enabled on a member.

License Pool Utilization

The License Pool Utilization dashboard provides information about the utilization of the dynamic licenses in a given time frame. This dashboard displays the total number of dynamic licenses available, percentage of pooled license allocation over time and other related information for each license pool. You can display the report data in table format, in line graph format, or both. Each of the line graphs, represented with a different color, is the utilization of licenses in one particular pool. The default dashboard displays the license pool utilization data for all the license pools. However, you can view the license pool utilization data for a specific license pool.

The default dashboard displays the following information:

- **Period/Date:** The time span of the license pool utilization.
- **License Pool:** The license pool such as vNIOS, DNS, DHCP, Grid, Cloud Platform, vNIOS CP-V800, and so on.
- **Total License Count:** The total number of available licenses.
- **Utilization (%):** The percentage of license pool utilization.

**Note:** The member details are not updated for alert emails in the Traffic Rate by Member report if the rises-by/drops-by operator is used. However, the member details are updated if you use the operators like greater than/less than in the alert filter.

System Capacity Prediction Trend

The System Capacity Prediction Trend dashboard forecasts the date and timestamp when the system resources such as CPU, database objects, DHCP leases, DNS queries meet its thresholds based on the current usage trends for the selected Grid member. This dashboard helps you determine the current usage, thresholds, and the predicted utilization over time. Using this dashboard, you can avoid unexpected usage of resources in your environment. In addition, you can scale the functional capacity for different appliance models.

The default dashboard displays the following information:

- **CPU Threshold**
  - **Max CPU Utilization:** Displays the maximum CPU used by the selected member.
  - **CPU Threshold Prediction:** Displays the predicted date and time when the CPU usage might reach its threshold based on your current usage.
  - **CPU Trend Prediction:** Displays the line graph to show the actual, threshold, and predicted CPU usage with a different color for the selected member and model type.
• **DB Objects Threshold**
  - **Max DB Objects Utilization**: The maximum number of database objects that is in use for the selected member.
  - **DB Objects Threshold Prediction**: Displays the predicted date and time when the database objects reach its thresholds based on your current usage trend.
  - **DB Objects Trend Prediction**: Displays the line graphs with different colors to show the actual database objects usage, database threshold value, and predicted database objects usage.

• **DNS Thresholds**
  - **Datasheet Max QPS**: The maximum number of queries sent to the selected member.
  - **QPS Threshold Prediction**: Displays the predicted date and time when the queries might reach its threshold based on your current trend.
  - **QPS Prediction**: Displays line graphs to show the actual number of queries, threshold, and predicted number of queries with a different color for the selected member.

• **DHCP Thresholds**
  - **Datasheet Max LPS**: Displays the appliance model and the number of DHCP leases issued.
  - **LPS Threshold Prediction**: Displays the predicted date and time when the DHCP leases might reach its threshold based on your current usage trend.
  - **DHCP Activity Prediction**: Displays the line graphs with a different color to show the actual, threshold, and predicted count of DHCP leases.

**IPAM Prediction Dashboard**

The IPAM Prediction dashboard provides information about the subnet utilization and DHCPv4 utilization in a graphical form to track the address usage trends over a time frame. This dashboard predicts the number of addresses used, configured thresholds for IPAM utilization, and forecasts the estimated address usage based on the current usage trends. Each of the line graphs is represented with a different color.

**Internal Reports**

You can monitor information about index volume usage on the reporting server for each report category and reporting members. You can track volume usage statistics by generating the following internal reports:

- Reporting Index Usage Statistics
- Reporting Volume Usage Trend per Category
- Reporting Volume Usage Trend per Member

**Reporting Index Usage Statistics**

The Reporting Index Usage Statistics dashboard provides information about the current disk space in use and the maximum index space configured for a reporting index. For information about the maximum index size allocated for each index, see Table 40.8. The dashboard shows a bar chart for Index Disk Usage trend. You can mouse over the bar to view the index volume usage/maximum index space allocated for that reporting index.

**Note**: The Reporting Index Usage Statistics dashboard displays information for only those indexes that demonstrate activities or disk usage. So even if the indexes are enabled but have no activity or disk usage, then information about these indexes is not displayed in the Reporting Index Usage Statistics dashboard.

This dashboard shows the following information:

- **Index (Reporting Member)**: The name of the index that holds specific types of reporting data.
- **Index Disk Usage Trend (% used/day)**: The percentage of index disk usage on a daily basis. The trend shows the impact of changing the reporting partition disk allocation and index capacities.
- **Earliest Event**: The timestamp of the earliest event in the index.
- **Max Volume (MB)**: The maximum index volume configured.
- **Usage (%)**: The percentage of disk space that is currently in use for the index.
- **Volume (MB)**: The current index volume in use.

**Reporting License Usage**

The Reporting License Usage dashboard provides license usage over a given time frame and license usage warning count if there is any license usage violation. The default dashboard displays bar chart that shows license usage in megabytes over a given time frame. This dashboard shows the following information:

- **License Usage (MB)**: The total reporting volume used by each report category in megabytes.
- **Time**: The timestamp of license usage.
- **License Usage Warning Count**: The warning count triggered due to license usage violation.
Reporting Volume Usage Trend per Category

The Reporting Volume Usage Trend per Category dashboard provides reporting volume usage trends over a given time frame. The default dashboard displays line chart that show reporting volume usage trends for report categories over the last day. This dashboard shows the following information:

- **Volume (MB):** The total reporting volume used by each report category in megabytes.
- **Time:** The timestamp of events.

Reporting Volume Usage Trend per Member

The Reporting Volume Usage Trend per Member dashboard provides reporting volume usage trends on members in a given time frame. The default dashboard shows line graphs that track reporting volume usage trends on a member within the last day. This dashboard shows the following information:

- **Volume (MB):** The total reporting volume used by each reporting member in megabytes.
- **Time (UTC):** The timestamp of events.

Managing Reporting Data

You can do the following to manage the Reporting and Analytics App:

- Upgrade Reporting and Analytics App, as described in Upgrading Reporting and Analytics App.
- Back up the reporting data, as described in Backing Up Reporting Data.
- Schedule the backup of the Reporting and Analytics App, as described in Scheduling the Backup of the Reporting Database.
- Restore the Reporting and Analytics App, as described in Restoring the Reporting Database.

Upgrading Reporting and Analytics App

You can download the latest version of the Infoblox Reporting and Analytics App from the Infoblox Support site. You can then upgrade this App on your reporting server.

To upgrade the Reporting and Analytics App:

1. Check your current version of the App in the Reporting Help tab.
2. Check if there is a later version that is available on the Infoblox Support site.
3. Download the .bin2 file from Infoblox Support site.
4. From the Administration tab, select the Reporting tab.
5. Click Upgrade Reporting & Analytics App from the Toolbar.
6. In the Upgrade Reporting & Analytics App dialog box, click Select. In the Upload dialog box, click Select, navigate to the .bin2 file, select it, and then click Upload.
7. After the Reporting and Analytics App is upgraded, click Restart to restart the Reporting service.

Backing Up and Restoring the Infoblox Reporting and Analytics App

To back up the Reporting and Analytics App, go to the Grid tab, select Backup -> Grid Backup -> Manual Backup from the Toolbar, and then select Infoblox Reporting & Analytics App to back up the app. When you back up the Reporting and Analytics App, the backup file is a .bak file that contains the reporting settings configured in the Grid Reporting Properties.

To restore the Reporting and Analytics App, go to the Grid tab, select Restore -> Restore Grid from the Toolbar, and then select Infoblox Reporting & Analytics App to restore the app.

Backing Up Reporting Data

Before you back up the reporting database, ensure that the reporting service is enabled on the reporting server. You cannot perform or schedule a backup if the reporting service is disabled on the reporting server. If you want to upgrade your reporting server, back up all the data. If you want to upgrade your reporting server, back up all the data before you power down the server. During an upgrade, the reporting server is automatically upgraded after the Grid Master. You cannot control or schedule when to upgrade the reporting server. For information about upgrades and upgrade groups, see Managing Upgrade Groups.

Note that reporting data backups are incremental backups, which means that backup files are copied to the designated file server only when there are new events generated since the last backup. Backing up of the reporting database to an FTP or SCP server using IPv4 or IPv6 is supported. The backup file is a .tar.gz file that contains the reporting data.

**Note:** If you stop an ongoing backup process, backup files are still being copied to the designated file server. When you perform a subsequent backup, the appliance appends incremental data to these backup files.

You can manually back up the reporting database or schedule a backup, but you cannot perform both at the same time. The backup process starts when the indexed data rolls from the hot bucket to the warm bucket. The hot bucket includes all inbound events and actively written data.
Indexed data moves to the warm bucket when one of the following conditions is met:

- The size of the reporting data reaches 1 GB
- Data is 90 days old
- The reporting server restarts

You can perform the following reporting data backups:

- Manual backups, as described in *Backing Up the Reporting Database Manually*.
- Scheduled backups, as described in *Scheduling the Backup of the Reporting Database*.

### Backing Up the Reporting Database Manually

1. From the **Grid** tab, select **Backup -> Reporting Backup -> Manual Backup** from the Toolbar.
2. In the **Manual Reporting Backup** editor, complete the following:
   - **Backup to**: Select the destination of the backup file from the drop-down list:
     - **FTP**: Back up the reporting database to an FTP server.
     - **Filepath**: Enter the directory path. For example, you can enter `/archive/backups/Infoblox/`
     - **IP Address of FTP Server**: The IP address of the FTP server.
     - **Username**: Enter the username of your FTP account.
     - **Password**: Enter the password of your FTP account.
     - **SCP**: Back up the reporting database to an SSH server that supports SCP.
     - **Filepath**: Enter the directory path. For example, you can enter `/archive/backups/Infoblox/`
     - **IP Address of SCP Server**: The IP address of the SCP server.
     - **Username**: Enter the username of your SCP account.
     - **Password**: Enter the password of your SCP account.

**Note**: When you select FTP or SCP, ensure that you have a valid username and password on the server prior to backing up the files.

### Scheduling the Backup of the Reporting Database

1. From the **Grid** tab, select **Backup -> Reporting Backup -> Schedule Backup** from the Toolbar.
2. In the **Schedule Reporting Backup** editor, complete the following:
   - **Status**: Displays the status of the backup process of the last operation. Select the destination of the backup file from the **Backup to drop-down list**:
     - **FTP**: Back up the reporting database files to an FTP server.
     - **Filepath**: Enter the directory path. For example, you can enter `/archive/backups/Infoblox/`
     - **IP Address of FTP Server**: The IP address of the FTP server.
     - **Username**: Enter the username of your FTP account.
     - **Password**: Enter the password of your FTP account.
     - **SCP**: Back up the reporting database to an SSH server that supports SCP.
     - **Filepath**: Enter the directory path. For example, you can enter `/archive/backups/Infoblox/`
     - **IP Address of SCP Server**: The IP address of the SCP server.
     - **Username**: Enter the username of your SCP account.
     - **Password**: Enter the password of your SCP account.

**Recurrence** Select how often you want to back up the files. You can select **Weekly**, **Daily**, or **Hourly** from the drop-down list. When you select **Weekly**, complete the following:
   - **Every**: Choose a day of the week from the drop-down list.
   - **Time**: Enter a time in the `hh:mm:ss AM/PM` format. You can also click the clock icon and select a time from the drop-down list. The Grid Master creates a backup file on the selected day and time every week.

When you select **Daily**, enter a time in the `hh:mm:ss AM/PM` format. You can also select a time from the drop-down list.

When you select **Hourly**, complete the following:
   - **Minutes after the Hour**: Enter the minute after the hour when the Grid Master creates a backup file. For example, enter 5 if you want the Grid Master to create a backup file five minutes after the hour every hour.
   - **Disable Scheduled Backup**: Select this if you want to disable automatic backups from occurring now, but want to save the settings for future use.

**Note**: When you select FTP or SCP, ensure that you have a valid username and password on the server prior to backing up the files.
Restoring the Reporting Database

Restoring the reporting database may take a long time to perform, and the reporting service is unavailable during a restore. Ensure that you must restore the reporting database before you perform the operation. Restoring of reporting database from an FTP or SCP server using IPv4 or IPv6 is supported.

Note the following during a restore:

- The reporting service is unavailable.
- Existing reporting data is removed from the reporting server.
- Backup data is restored up to the amount the reporting server can accommodate.

Note: The Volume Used Today displayed in the Device Information section will not be updated after restoring the data. Also, when you restore data or execute the CLI command reset reporting_data, the volume violation count will be reset to zero on the second day.

1. From the Grid tab, select Restore -> Restore Reporting from the Toolbar.
2. In the Restore dialog box, complete the following:
   - Status: Displays the status of the restore process, if in progress.
   - Select the destination of the backup file from the Restore from drop-down list:
     - FTP: Restore the reporting backup files from an FTP server.
       - Filepath: Enter the directory path. For example, you can enter /archive/backups/Infoblox/.
       - IP Address of FTP Server: The IP address of the FTP server.
       - Username: Enter the username of your FTP server account.
       - Password: Enter the password of your FTP server account.
     - SCP: Restore the reporting backup files from a SCP server.
       - Filepath: Enter the directory path. For example, you can enter /archive/backups/Infoblox/.
       - IP Address of SCP Server: The IP address of the SCP server.
       - Username: Enter the username of your SCP server account.
       - Password: Enter the password of your SCP server account.
3. Click Restore.

Infoblox-4030 Supported Dashboards

The IB-4030 appliance provides the following predefined dashboards:

DNS Reports
- DNS Replies Trend
- DNS Top Clients
- DNS Query Rate by Query Type
- DNS Response Latency Trend
- DNS Query Rate by Member
- DNS Replies Trend
- DNS Replies Trend
- DNS Top SERVFAIL Errors Sent
- DNS Top SERVFAIL ErrorsReceived
- DNS Top Timed-out RecursiveQueries
- DNS Top Requested DomainNames
- DNS Top Clients
- DNS Top NXDOMAIN /NOERROR (no data)

Security (DNS) Reports
- DNS Top RPZ Hits
- DNS Top RPZ Hits by Clients
- FireEye Alerts
- Threat Protection Event Count By Severity Trend
- Threat Protection Event Count By Rule
- Threat Protection Event Count By Time
- Threat Protection Event Count By Category
- Threat Protection Event Count By Member
- Threat Protection Event Count By Member Trend
- DNS Top Tunneling Activity
- DNS Tunneling Traffic by Category
- Top Malware and DNS Tunneling Events by Client

System Reports
• CPU Utilization Trend
• Memory Utilization Trend
• Traffic Rate by Member
• License Pool Utilization

Reports with Data Synchronized from Microsoft Servers

**Note:** The DNS reports listed in the following table displays data synchronized from the Microsoft servers only when you have enabled synchronization of reporting data for the Grid or the Microsoft servers. For information about enabling synchronization of DNS reporting data from the Microsoft server, see [Synchronizing DNS Reporting Data](#).

Infoblox supports the following versions of Microsoft Windows servers in displaying reporting data from both NIOS and the Microsoft servers:

The following reports display data from both NIOS and the Microsoft servers:

**DNS Reports**

- DNS Top Requested Domain Names
- DNS Top Clients
- DNS Top Clients Per Domain
- DNS Query Rate by Query Type
- DNS Query Rate by Member
- DNS Daily Query Rate by Member
- DNS Daily Peak Hour Query Rate by Member
- DNS Top NXDOMAIN/NOERROR (no data)
- DNS Top SERVFAIL Errors Sent
- DNS Top SERVFAIL Errors Received
- DNS Top Timed-out Recursive Queries
- DNS Query Trend per IP Block Group
- DDNS Update Rate Trend

Following DNS reports are generated if a Data Collector VM is registered with the Grid:

- DNS Domain Queried by Client
- DNS Domain Query Trend
- Top DNS Clients by Query Type
- Top DNS Clients Querying MX Records

**DHCP Reports**

- DHCPv4 Usage Trend
- DHCPv4 Usage Statistics
- DHCPv4 Range Utilization Trend
- DHCPv4 Top Utilized Networks
- DHCP Lease History
- DHCP Top Lease Clients
- DHCP Message Rate Trend

**IPAM Reports**

- IPAMv4 Network Usage Statistics
- IPAMv4 Network Usage Trend
- IPAMv4 Top Utilized Networks

## Chapter 41 Reporting Data Model

This section contains information about fields that are included in the reports and dashboards. You can find the commonly extracted fields and their specifications such as data source and range, which can help you better define your dashboards and searches.

**Splunk default fields**
Splunk server adds the following default fields to each event in every index.

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Description</th>
<th>Values/Range</th>
</tr>
</thead>
<tbody>
<tr>
<td>date_hour</td>
<td>Indicates the hour when an event occurred. To narrow your search for specific event timestamps, you can use the default datetime fields. Click <a href="#">here</a> for more information on datetime fields.</td>
<td>Range: 0-23</td>
</tr>
<tr>
<td>date_mday</td>
<td>Indicates the day of the month when the event occurred</td>
<td>Range: 1-31</td>
</tr>
<tr>
<td>date_minute</td>
<td>Indicates the exact minute when the event occurred</td>
<td>Range: 0-59</td>
</tr>
<tr>
<td>date_month</td>
<td>Indicates the month during which an event occurred</td>
<td></td>
</tr>
<tr>
<td>date_second</td>
<td>Indicates the second in which an event occurred</td>
<td>Range: 0-59</td>
</tr>
<tr>
<td>date_wday</td>
<td>Indicates the day of the week in which an event occurred</td>
<td>Example: Sunday, Monday, etc.</td>
</tr>
<tr>
<td>date_year</td>
<td>Indicates the year in which an event occurred</td>
<td></td>
</tr>
<tr>
<td>date_zone</td>
<td>Indicates the time for the local timezone of an event, expressed as hours in Unix Time</td>
<td></td>
</tr>
<tr>
<td>eventtype</td>
<td>Indicates events of the same type based on a given search. Click <a href="#">here</a> for more information.</td>
<td>Example: splunkd-log</td>
</tr>
<tr>
<td>host</td>
<td>Contains information about the originating hostname or a network IP address that generates the event</td>
<td>Example: reporting-1.com</td>
</tr>
<tr>
<td>index</td>
<td>Contains the name of the index with which a given event is indexed</td>
<td>Example: ib_dns_summary</td>
</tr>
<tr>
<td>linecount</td>
<td>Contains information about the number of lines in an event before it is indexed</td>
<td>Example: 1</td>
</tr>
<tr>
<td>punct</td>
<td>Contains information about the pattern of the first thirty punctuation characters in the first line of the event with which it is associated. It shows how an event looks when all letters, numbers, and spaces are removed and contains characters such as periods, colons, parentheses, quotes, question marks, dashes, and underscores. Click here for more information.</td>
<td>Example: -:[]_--=/</td>

</table>

**Commonly extracted fields**

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Description</th>
<th>Values/Range</th>
<th>Source of Data</th>
</tr>
</thead>
<tbody>
<tr>
<td>date_hour</td>
<td>Indicates the hour when an event occurred. To narrow your search for specific event timestamps, you can use the default datetime fields. Click <a href="#">here</a> for more information on datetime fields.</td>
<td>Range: 0-23</td>
<td></td>
</tr>
<tr>
<td>date_mday</td>
<td>Indicates the day of the month when the event occurred</td>
<td>Range: 1-31</td>
<td></td>
</tr>
<tr>
<td>date_minute</td>
<td>Indicates the exact minute when the event occurred</td>
<td>Range: 0-59</td>
<td></td>
</tr>
<tr>
<td>date_month</td>
<td>Indicates the month during which an event occurred</td>
<td></td>
<td></td>
</tr>
<tr>
<td>date_second</td>
<td>Indicates the second in which an event occurred</td>
<td>Range: 0-59</td>
<td></td>
</tr>
<tr>
<td>date_wday</td>
<td>Indicates the day of the week in which an event occurred</td>
<td>Example: Sunday, Monday, etc.</td>
<td></td>
</tr>
<tr>
<td>date_year</td>
<td>Indicates the year in which an event occurred</td>
<td></td>
<td></td>
</tr>
<tr>
<td>date_zone</td>
<td>Indicates the time for the local timezone of an event, expressed as hours in Unix Time</td>
<td></td>
<td></td>
</tr>
<tr>
<td>eventtype</td>
<td>Indicates events of the same type based on a given search. Click <a href="#">here</a> for more information.</td>
<td>Example: splunkd-log</td>
<td></td>
</tr>
<tr>
<td>host</td>
<td>Contains information about the originating hostname or a network IP address that generates the event</td>
<td>Example: reporting-1.com</td>
<td></td>
</tr>
<tr>
<td>index</td>
<td>Contains the name of the index with which a given event is indexed</td>
<td>Example: ib_dns_summary</td>
<td></td>
</tr>
<tr>
<td>linecount</td>
<td>Contains information about the number of lines in an event before it is indexed</td>
<td>Example: 1</td>
<td></td>
</tr>
<tr>
<td>punct</td>
<td>Contains information about the pattern of the first thirty punctuation characters in the first line of the event with which it is associated. It shows how an event looks when all letters, numbers, and spaces are removed and contains characters such as periods, colons, parentheses, quotes, question marks, dashes, and underscores. Click here for more information.</td>
<td>Example: -:[]_--=/</td>

<td>sourcetype</td>
<td>Specifies the format of data input from which the event originates</td>
<td>Stash</td>
<td></td>
</tr>
<tr>
<td>splunk_server</td>
<td>Contains the name of the Splunk server that comprises the event</td>
<td>Example: reporting-2.com-2-slave</td>
<td></td>
</tr>
<tr>
<td>splunk_server_group</td>
<td>Contains the name of the Splunk server group</td>
<td>String</td>
<td></td>
</tr>
</tbody>
</table>
EA

Specifies the extensible attribute

String

| __grouping_by_ea_tag_lookup lookup from /storage/splunk/etc/apps/infoblox/lookups/grouping_by_ea_tag_map.csv with host value as input |
| pool_ea_lookup_csv lookup from /storage/splunk/etc/apps/infoblox/lookups/idns_pools.csv with pool value as input |
| resource_pool_ea_lookup_csv lookup from /storage/splunk/etc/apps/infoblox/lookups/idns_resources.csv with RESOURCE value as input |
| network_ea_lookup_csv lookup from /storage/splunk/etc/apps/infoblox/lookups/network.csv with NETWORK value as input |

HWTYPE

Specifies the hardware type

Example: IB-4030

| nios_member_hw_lookup lookup from /storage/splunk/etc/apps/infoblox/lookups/nios_member_hw.csv with host value as input |

MAX_DB_OBJECTS

Specifies the maximum objects in the database for a host

eg: 8000000

| nios_member_hw_lookup lookup from /storage/splunk/etc/apps/infoblox/lookups/nios_member_hw.csv with host value as input |

MAX_DHCP_LPS

Specifies the maximum number of DHCP leases per second for a host

Example: 15.0

| nios_member_hw_lookup lookup from /storage/splunk/etc/apps/infoblox/lookups/nios_member_hw.csv with host value as input |

MAX_DNS_QPS

Specifies the maximum DNS queries per second for a host

Example: 1000000.0

| nios_member_hw_lookup lookup from /storage/splunk/etc/apps/infoblox/lookups/nios_member_hw.csv with host value as input |

MEMBER_IP

Specifies the IP address of the member

IP address

| nios_member_hw_lookup lookup from /storage/splunk/etc/apps/infoblox/lookups/nios_member_hw.csv with host value as input |

timeendpos

 Specifies the byte at which the timestamp ends. These values are based on the TIME_FORMAT that is specified for a sourcetype under props.conf.

Example: 26

timestartpos

 Specifies the byte at which the timestamp starts

Example: 0

Indexes and Extracted Data

Infoblox Audit Logs

Most of the fields in this index are extracted directly from the audit.log file. Some of them are mentioned in the table below:

<table>
<thead>
<tr>
<th>Extracted Field Name</th>
<th>Description of the field</th>
<th>Values/Range</th>
<th>Source of Data</th>
</tr>
</thead>
<tbody>
<tr>
<td>ACTION</td>
<td>Indicates the action taken</td>
<td>String. Example: Called</td>
<td>Infoblox audit logs</td>
</tr>
<tr>
<td>ADMIN</td>
<td>Indicates the name of the admin</td>
<td>String. Example: root</td>
<td>Infoblox audit logs</td>
</tr>
<tr>
<td>EA</td>
<td>Common Extracted fields</td>
<td></td>
<td></td>
</tr>
<tr>
<td>EXEC_STATUS</td>
<td>Indicates the execution status</td>
<td>String. Example: Pending Approval</td>
<td>Infoblox audit logs</td>
</tr>
<tr>
<td>HWTYPE</td>
<td>Common Extracted fields</td>
<td></td>
<td></td>
</tr>
<tr>
<td>MAX_DB_OBJECTS</td>
<td>Common Extracted fields</td>
<td></td>
<td></td>
</tr>
<tr>
<td>MAX_DHCP_LPS</td>
<td>Common Extracted fields</td>
<td></td>
<td></td>
</tr>
<tr>
<td>MAX_DNS_QPS</td>
<td>Common Extracted fields</td>
<td></td>
<td></td>
</tr>
<tr>
<td>MEMBER_IP</td>
<td>Common Extracted fields</td>
<td>MESSAGE</td>
<td>Indicates the message</td>
</tr>
<tr>
<td>OBJECT_NAME</td>
<td>Indicates the object name</td>
<td>OBJECT_TYPE</td>
<td>Indicates the object type</td>
</tr>
<tr>
<td>TIMESTAMP</td>
<td>Indicates the timestamp</td>
<td>action</td>
<td>Indicates the action</td>
</tr>
<tr>
<td>address</td>
<td>Example: 10.0.0.0</td>
<td>auth</td>
<td>Example: Local</td>
</tr>
<tr>
<td>cidr</td>
<td>Example: 8</td>
<td>code</td>
<td>Example: created</td>

- **latest time** - specifies the latest time for a saved search

### Common fields in summary indexes

Splunk server adds the following fields to every event in each summary index.

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Description of the field</th>
<th>Values/Range</th>
<th>Remarks</th>
</tr>
</thead>
<tbody>
<tr>
<td>info_max_time</td>
<td>The info_* fields are added to each event when you use the addinfo command. This command is primarily an internally-used component of Summary Indexing. Click here for more information. The latest time boundary for the search.</td>
<td>Integer</td>
<td>Splunk added special field</td>
</tr>
<tr>
<td>info_min_time</td>
<td>Specifies the earliest time boundary for search</td>
<td>Integer</td>
<td>Splunk added special field</td>
</tr>
<tr>
<td>info_search_time</td>
<td>Specifies the time when search was initiated</td>
<td>Integer</td>
<td>Splunk added special field</td>
</tr>
<tr>
<td>search_name</td>
<td>Specifies the name of the saved search</td>
<td>Example: si-search-dns-query-reply</td>
<td>Splunk added special field</td>
</tr>
<tr>
<td>search_now</td>
<td>Specifies the time when search was scheduled to run</td>
<td>Integer</td>
<td>Splunk added special field</td>
</tr>
</tbody>
</table>

### Infoblox DNS Summary

Note: "psrsvd" stands for "prestats reserved". Syntax is psrsvd_[\(type\)][\(fieldname\)]. These special fields are added by Splunk to summary index data that begins with "psrsvd" when you initiate search using the "si**" command to populate a summary index. See List of available psrsvd types from Splunk docs.

### When to Update?

You must update this document in the following scenarios of the reporting data model:

- When new indexes are introduced.
- When new fields are added to or deleted from existing indexes.
- Cron schedules of existing summary indexes are modified.
- Cron schedules are added for a new summary.

### How to Update?

Please read the following before you update this document:

1. Populate the required index with data in the Grid setup.
2. Use the following command to get a list of all fields within each index:
   ```shell
   index=ib_xxxx | fieldsummary
   ```
3. Add those lists of fields to the table in the index.
4. Determine sample field values from search results.
5. Manually figure out the source data path of each field.

For existing fields go through:

- `default/props.conf`
- `default/transforms.conf`
- `default/savedsearches.conf` configuration files from IBRA code
- `products/reporting/server/src/pyutil/reporting_config_writer_util.py` from NIOS code.

The following path is commonly found for file based (like .csv, .txt, .log) extractions in each forwarder: `/infoblox/var/reporting/
Lookup files path in an indexer: `/storage/splunk/etc/apps/infoblox/lookups/`
Part 8 Infoblox Infrastructure Security

The mission-critical DNS infrastructure can become a vulnerable component in your network when it is inadequately protected by traditional security solutions and consequently used as an attack surface. Compromised DNS services can result in catastrophic network and system failures. To fully protect your network in today's cyber security threat environment, Infoblox sets a new DNS security standard by offering scalable, enterprise-grade, and integrated protection for your DNS infrastructure.

While your external (internet-facing) DNS server can be subject to cyber attacks such as DNS DDoS (Distributed Denial of Service) and others, threats can also come from the inside of your firewalls. Today's targeted attacks pose risk to both data and infrastructure inside an enterprise. You could have an endpoint infected with malware or threats trying to communicate with C&C (Command-and-Control) servers that use DNS as a protocol. You could also have a malicious insider trying to steal valuable digital assets by opening a DNS tunnel or embedding data in DNS queries.

Depending on how you want to protect your mission-critical DNS infrastructure, you can configure your Infoblox appliance to mitigate against external, internal, or both (external and internal) DNS threats. This section contains information about the Infoblox infrastructure security features that protect external DNS from cyber DNS attacks and internal DNS from infrastructure attacks, data exfiltration, and APTs (Advanced Persistent Threats) and malware.

- **Infoblox Advanced DNS Protection**

  The Infoblox Advanced DNS Protection solution employs hardware-accelerated security rules to detect, report upon, and stop attacks such as DDoS, DNS reflection, DNS amplification, DNS hijacking, and other network attacks targeting DNS authoritative applications. This security solution helps minimize "false positives" and ensures that your mission-critical DNS services continue to function even when under attack. For more information, see [Infoblox Advanced DNS Protection](#).

- **Infoblox DNS Firewall**

  Infoblox DNS Firewall uses DNS RPZs (Response Policy Zones) for allowing reputable sources to dynamically communicate reputation domain names so you can implement policy controls for DNS lookups. For more information, see [Infoblox DNS Firewall](#).

- **Infoblox Threat Insight**

  The Infoblox Threat Insight solution defends against data exfiltration through DNS tunneling for ultimate network protection. For more information, see [Infoblox Threat Insight](#).

- **Security Ecosystem**

  The Infoblox security ecosystem comprises FireEye integrated RPZs for detecting malware and APTs and the TAXII (Trusted Automated eXchange of Indicator Information) service for mitigating cyber attacks. For more information, see [Infoblox DNS Firewall](#).

  For best practices in securing your networks, you can also set up DNS blacklists or configure a security banner. When you enable DNS Integrity Check for top-level authoritative zones, the appliance verifies DNS data in the NS RRsets and glue records, and reports any data discrepancies so you can mitigate possible DNS domain hijacking.

  Following are other DNS security features for your network security:

  - **Access Control (Named ACLs)**

    To effectively manage your core network services, you can grant legitimate hosts access to specific operations on the appliance using an ACL (access control list) or anonymous ACEs (access control entries). You can also configure a named ACL and apply it to multiple operations, such as file distribution and DNS zone transfers. For more information, see [Configuring Access Control](#).

  - **DNS blacklists**

    Your organization can prevent customers or employees from accessing certain Internet resources, particularly web sites, by prohibiting a recursive DNS member from resolving queries for domain names that you specify. You can configure a recursive DNS member to redirect the DNS client to predefined IP addresses or return a REFUSED response code (indicating that resolution is not performed because of local policy), depending on the domain name. For more information, see [About Blacklists](#).

  - **Security Banner**

    You can configure and publish a notice and consent banner as the first login screen that includes specific terms and conditions you want end users to accept before they log in to the Infoblox Grid. When you enable the notice and consent banner, users must accept the terms and conditions displayed on the consent screen before accessing the login screen of Grid Manager. For more information, see [Configuring Notice and Consent Banner](#).

  - **DNS Integrity Check**

    DNS domain hijacking or domain theft is the act of changing the registration of a domain name without the permission of its original registrant. In some cases, hijackers change the DNS data of a domain after gaining control of it. They consequently redirect users to a fraudulent site, instead
of the legitimate site, on the Internet. To protect your authoritative DNS servers against this type of domain hijacking, you can configure the appliance to monitor NS records and glue records for top-level authoritative zones. Based on your configuration, the appliance periodically checks the DNS data for the zones and compares the data with that in the appliance database. The severity in data discrepancies can help identify possible domain hijacking. For more information about this feature, see About DNS Integrity Check for Authoritative Zones.

Chapter 41 Infoblox Advanced DNS Protection

This chapter describes the Infoblox Advanced DNS Protection solution and its features. It explains how to enable and disable the threat protection service, define threat protection rule settings, and manage threat protection rules so you can protect your internet-facing authoritative servers. It contains the following sections:

- About Infoblox Advanced DNS Protection
  - Configuring Infoblox Advanced DNS Protection
  - Supported Threat Protection Appliances and Licensing Requirements
  - Administrative Permissions
  - Starting and Stopping Threat Protection Service
  - Enabling and Disabling Monitoring Mode
- Understanding Threat Protection Rulesets and Rules
  - About Ruleset Versions and Updates
  - System and Auto Rules
  - Custom Rules
  - Creating Custom Rules
- Configuring Grid Security Properties
  - Enabling Multiple DNS Requests through a Single TCP Session
  - Configuring NAT Mapping Properties
- Managing Threat Protection Rulesets
  - Viewing Threat Protection Rulesets
  - Activating a Ruleset
  - Overriding the Grid Ruleset
  - Modifying Rulesets
  - Comparing and Merging Rulesets
  - Manually Uploading Rulesets
  - Publishing Rule Updates
- Configuring Threat Protection Profiles
  - Adding Threat Protection Profiles
  - Cloning Threat Protection Profiles
  - Modifying Threat Protection Profiles
  - Merging Threat Protection Profiles
  - Inheriting Grid Rule Settings
  - Deleting Threat Protection Profiles
  - Viewing Threat Protection Profiles
- Managing Threat Protection Rules
  - Viewing Threat Protection Rules
  - Enabling and Disabling Rules
  - Modifying System and Auto Rules
  - Publishing Rule Updates
  - Modifying System and Auto Rules
  - Modifying Custom Rules
  - Monitoring Threat Protection Events
- Monitoring Threat Protection Events
  - Monitoring through Syslog
  - Threat Protection Statistics Widget
  - Threat Protection Reports
- DNS and Network-Flood Threats
  - Internet Control Message Protocol (ICMP) Flood
  - SYN Flood
  - UDP DNS Flood
  - Inside-Out Attacks
  - DNS Fluxing
  - DNS Cache Poisoning
  - DNS Reflection and Amplification Attacks
  - DNS Malware
  - DNS Domain Hijacking

About Infoblox Advanced DNS Protection

The Infoblox Advanced DNS Protection solution employs threat protection rules to detect, report upon, and stop DoS (Denial of Service), DDoS (Distributed Denial of Service) and other network attacks targeting DNS authoritative applications. Infoblox Advanced DNS Protection helps
minimize "false positives" and ensures that your mission-critical DNS services continue to function even when under attack. For information about possible DNS threats, see DNS and Network-Flood Threats.

You can deploy the Advanced DNS Protection solution on hardware-accelerated appliances (physical appliances only) as well as software-based appliances (both physical and virtual) in the Grid. Depending on the appliances you deploy, you must install applicable hardware-based licenses or Software ADP subscription licenses. For information about supported Infoblox appliances for Advanced DNS Protection and the applicable licenses, see Supported Threat Protection Appliances and Licensing Requirements.

Infoblox Advanced DNS Protection is designed to provide visibility and protection against network floods and DNS attacks. It detects DNS attacks through predefined and custom threat protection rules, and mitigates DNS threats by dropping problematic packets while responding only to legitimate traffic. With valid licenses installed, you can subscribe to automatic rule updates that deliver near real-time protection against new and emerging attacks. You may also manually perform the rule update process based on your configuration. For information about threat protection rules, see Understanding Threat Protection Rulesets and Rules.

Infoblox Advanced DNS Protection supports a set of predefined threat protection rules that detect and mitigate possible DNS threats. You can modify some of the parameters and assign actions such as logging events and applying mitigation to these rules. You can also create custom rules to suit your security needs. For more information, see Understanding Threat Protection Rulesets and Rules.

As illustrated in Figure 43.1, the threat protection appliance, acting as an authoritative DNS server, is added to the Grid. After installing valid threat protection licenses and configuring the appliance to serve as an Advance Appliance, it can now detect DNS threats and mitigate DNS threats based on threat protection rules. All threat protection related events, conformed to CEF (Common Event Format), are logged in the syslog on the Grid Master. To perform further investigation about possible threats, the reporting server generates specific threat protection related reports. For information about how to monitor threat protection related events and reports, see Monitoring Threat Protection Events.

**Figure 41.1 Infoblox Advanced DNS Protection Solution**

Limitations for Threat Protection Appliances

Hardware-based appliances support all existing DNS features (including HA support) that are applicable to DNS caching and authoritative applications, except the following:

- Configuration of multiple interfaces on the same subnet
- 10/100-Mbps gigabit Ethernet mode and fixed speed/duplex settings

**Note:** Even though you can configure static routes on the Infoblox-4030 Rev-2 appliance when DNS cache acceleration is enabled, cached DNS responses are always sent through the interface on which the queries arrive, not the interface that is configured for the static route.

Consider the following when the threat protection service is enabled on the Advance Appliances:

**For Hardware ADP**

- Protected interfaces (LAN1 and LAN2) are limited to DNS traffic, protocols in support of DNS anycast (BGP and OSPF) and the standard IP protocols such as ICMP, as well as connections to NTP servers.
- The MGMT interface is used for other traffic, such as Grid, SSH, SNMP, NTP, and it will not be protected against DDoS attacks.
- You cannot run other services, such as FTP, TFTP, and HTTP, on the Advance Appliances.
- The appliance terminates TCP connections for incoming DNS requests after handling the initial request through each TCP connection.
The exception for this default Grid setting is for an SOA query sent by a client that is accepted in the allow-transfer ACL. In the case of an SOA query, the TCP connection remains open for subsequent DNS requests. This exception also covers the case in which an AXFR query follows the SOA query through the same TCP connection. For more information about how to override this default Grid setting, see Enabling Multiple DNS Requests through a Single TCP Session.

For Software ADP

- When you use IB-FLEX for Software ADP, it supports a standalone or a Grid member with threat protection enabled, but it does not support a Grid Master with threat protection enabled. For more information about the IB-FLEX virtual appliance model, see About IB-FLEX X.
- IB-FLEX applies threat protection rules to all traffic on LAN1, LAN2 and HA interfaces, but bypasses the traffic on the MGMT interface.
- The threat protection profiles used for Software ADP members do not support ADP NAT settings. For more information, see Configuring Threat Protection Profiles. However, you can configure them for hardware-based threat protection members in the Member Security properties editor. For more information, see Configuring Grid Security Properties.

Chapter 42 Infoblox Advanced DNS Protection

This chapter describes the Infoblox Advanced DNS Protection solution and its features. It explains how to enable and disable the threat protection service, define threat protection rule settings, and manage threat protection rules so you can protect your internet-facing authoritative servers. It contains the following sections:

- About Infoblox Advanced DNS Protection
  - Configuring Infoblox Advanced DNS Protection
  - Supported Threat Protection Appliances and Licensing Requirements
  - Administrative Permissions
  - Starting and Stopping Threat Protection Service
  - Enabling and Disabling Monitoring Mode
- Understanding Threat Protection Rulesets and Rules
  - About Ruleset Versions and Updates
  - System and Auto Rules
  - Custom Rules
  - Creating Custom Rules
- Configuring Grid Security Properties
  - Enabling Multiple DNS Requests through a Single TCP Session
  - Configuring NAT Mapping Properties
- Managing Threat Protection Rulesets
  - Viewing Threat Protection Rulesets
  - Activating a Ruleset
  - Overriding the Grid Ruleset
  - Modifying Rulesets
  - Comparing and Merging Rulesets
  - Manually Uploading Rulesets
  - Publishing Rule Updates
- Configuring Threat Protection Profiles
  - Adding Threat Protection Profiles
  - Cloning Threat Protection Profiles
  - Modifying Threat Protection Profiles
  - Merging Threat Protection Profiles
  - Inheriting Grid Rule Settings
  - Deleting Threat Protection Profiles
  - Viewing Threat Protection Profiles
- Managing Threat Protection Rules
  - Viewing Threat Protection Rules
  - Enabling and Disabling Rules
  - Modifying System and Auto Rules
  - Publishing Rule Updates
  - Modifying System and Auto Rules
  - Modifying Custom Rules
  - Monitoring Threat Protection Events
- Monitoring Threat Protection Events
  - Monitoring through Syslog
  - Threat Protection Statistics Widget
  - Threat Protection Reports
- DNS and Network-Flood Threats
  - Internet Control Message Protocol (ICMP) Flood
  - SYN Flood
  - UDP DNS Flood
  - Inside-Out Attacks
  - DNS Fluxing
About Infoblox Advanced DNS Protection

The Infoblox Advanced DNS Protection solution employs threat protection rules to detect, report upon, and stop DoS (Denial of Service), DDoS (Distributed Denial of Service) and other network attacks targeting DNS authoritative applications. Infoblox Advanced DNS Protection helps minimize "false positives" and ensures that your mission-critical DNS services continue to function even when under attack. For information about possible DNS threats, see DNS and Network-Flood Threats.

You can deploy the Advanced DNS Protection solution on hardware-accelerated appliances (physical appliances only) as well as software-based appliances (both physical and virtual) in the Grid. Depending on the appliances you deploy, you must install applicable hardware-based licenses or Software ADP subscription licenses. For information about supported Infoblox appliances for Advanced DNS Protection and the applicable licenses, see Supported Threat Protection Appliances and Licensing Requirements.

Infoblox Advanced DNS Protection is designed to provide visibility and protection against network floods and DNS attacks. It detects DNS attacks through predefined and custom threat protection rules, and mitigates DNS threats by dropping problematic packets while responding only to legitimate traffic. With valid licenses installed, you can subscribe to automatic rule updates that deliver near real-time protection against new and emerging attacks. You may also manually perform the rule update process based on your configuration. For information about threat protection rules, see Understanding Threat Protection Rulesets and Rules.

As illustrated in Figure 41.1, the threat protection appliance, acting as an authoritative DNS server, is added to the Grid. After installing valid threat protection licenses and configuring the appliance to serve as an Advance Appliance, it can now detect DNS threats and mitigate DNS threats based on threat protection rules. All threat protection related events, conformed to CEF (Common Event Format), are logged in the syslog on the Grid Master. To perform further investigation about possible threats, the reporting server generates specific threat protection related reports. For information about how to monitor threat protection related events and reports, see Monitoring Threat Protection Events.

Limitations for Threat Protection Appliances

Hardware-based appliances support all existing DNS features (including HA support) that are applicable to DNS caching and authoritative applications, except the following:

- Configuration of multiple interfaces on the same subnet
- 10/100-Mbps gigabit Ethernet mode and fixed speed/duplex settings

Note: Even though you can configure static routes on the Infoblox-4030 Rev-2 appliance when DNS cache acceleration is enabled, cached DNS responses are always sent through the interface on which the queries arrive, not the interface that is configured for the static route.
Consider the following when the threat protection service is enabled on the Advance Appliances:

**For Hardware ADP**

- Protected interfaces (LAN1 and LAN2) are limited to DNS traffic, protocols in support of DNS anycast (BGP and OSPF) and the standard IP protocols such as ICMP, as well as connections to NTP servers.
- The MGMT interface is used for other traffic, such as Grid, SSH, SNMP, NTP, and it will not be protected against DDoS attacks.
- You cannot run other services, such as FTP, TFTP, and HTTP, on the Advance Appliances.
- The appliance terminates TCP connections for incoming DNS requests after handling the initial request through each TCP connection. The exception for this default Grid setting is for an SOA query sent by a client that is accepted in the allow-transfer ACL. In the case of an SOA query, the TCP connection remains open for subsequent DNS requests. This exception also covers the case in which an AXFR query follows the SOA query through the same TCP connection. For more information about how to override this default Grid setting, see *Enabling Multiple DNS Requests through a Single TCP Session*.

**For Software ADP**

- When you use IB-FLEX for Software ADP, it supports a standalone or a Grid member with threat protection enabled, but it does not support a Grid Master with threat protection enabled. For more information about the IB-FLEX virtual appliance model, see *About IB-FLEX*.
- IB-FLEX applies threat protection rules to all traffic on LAN1, LAN2 and HA interfaces, but bypasses the traffic on the MGMT interface.
- The threat protection profiles used for Software ADP members do not support ADP NAT settings. For more information, see *Configuring Threat Protection Profiles*. However, you can configure them for hardware-based threat protection members in the Member Security properties editor. For more information, see *Configuring Grid Security Properties*.

**Configuring Infoblox Advanced DNS Protection**

To enable and configure Infoblox Advanced DNS Protection on supported Infoblox appliances, complete the following:

1. Obtain valid Threat Protection, Threat Protection (Software add-on) and Threat Protection Update licenses from Infoblox and install them on the Infoblox Advance Appliances. For information about license requirements, see *Supported Threat Protection Appliances and Licensing Requirements*.
2. Optionally, you can set up an HA pair using the same appliance models for both the active and passive nodes. For information about HA pairs, see *About HA Pairs*. Note that you cannot configure Advance Appliances as an HA Grid Master or HA Grid Master candidate.
3. Enable threat protection service, as described in *Starting and Stopping Threat Protection Service*. For an HA pair, enable the service on both the active and passive nodes.
4. Configure threat protection rule settings for the Grid, including automatic or manual rule updates, as described in *Configuring Grid Security Properties*. If your network configuration requires rule updates to go through a proxy server, you can configure the appliance to use a proxy server to send rule updates. For more information, see *Configuring Proxy Servers*. You can also delegate ruleset updates to specific Grid members and change the default interface to an alternate interface, as described in *Configuring Members and Interfaces for Automatic Updates*. Define threat protection profiles for the Grid or specific members, as described in *Configuring Threat Protection Profiles*.
5. Optionally, you can do the following:
   - Override the default Grid setting that disables multiple DNS requests through one TCP session, as described in *Enabling Multiple DNS Requests through a Single TCP Session*.
   - Modify system rules, as described in *Modifying System and Auto Rules*.
   - Create custom rules using rule templates, as described in *Creating Custom Rules*.

After you have successfully set up Infoblox Advanced DNS Protection, you can do the following:

- View the current threat protection rules, as described in *Viewing Threat Protection Rules*.
- Modify system and custom threat protection rules, as described in *Managing Threat Protection Rules*.
- Manually upload rule updates, as described in *Manually Uploading Rulesets*.
- Publish uploaded rule updates, as described in *Publishing Rule Updates*.
- For manual updates, compare differences between two rulesets and merge parameter changes from an old ruleset into a new one, as described in *Comparing and Merging Rulesets*.
- Set the threat protection service in monitor mode, as described in *Enabling and Disabling Monitoring Mode*.
- Add threat protection profiles, as described in *Adding Threat Protection Profiles*.
- Clone threat protection profiles, as described in *Cloning Threat Protection Profiles*.
- Modify threat protection profiles, as described in *Modifying Threat Protection Profiles*.
- Merge threat protection profiles, as described in *Merging Threat Protection Profiles*.
- Inherit Grid rule settings for a threat protection profile, as described in *Inheriting Grid Rule Settings*.
- Delete a threat protection profile, as described in *Deleting Threat Protection Profiles*.
- View the current threat protection profiles, as described in *Viewing Threat Protection Profiles*.

**Supported Threat Protection Appliances and Licensing Requirements**

The Infoblox Advanced DNS Protection solution offers the following licenses: Threat Protection, Threat Protection (Software add-on), and Threat Protection Update. The following are descriptions for each of these licenses:
• **Threat Protection**: Install this license on the physical or hardware-based threat protection appliances. With valid licenses installed, Infoblox Advanced DNS Protection supports both IPv4 and IPv6. You can configure two appliances of the same model to form an HA pair for high availability configuration. For more information about how to configure an HA pair for Infoblox Advanced DNS Protection and its limitations, see *About HA Pairs*. You can configure hardware-based appliances in either IPv4, IPv6, or dual mode (IPv4 and IPv6) network environment.

**Note**: Reverting to an earlier NIOS release that does not support HA configuration for these appliances could cause a service outage.

• **Threat Protection (Software add-on)**: The Software ADP license is a subscription license. Grid Manager displays a warning message when the license expires. You must renew the license to use the Software ADP service. To renew the license, contact your Infoblox representative or Infoblox Technical Support. Before you obtain your permanent license, you can install a temporary license for Threat Protection (Software add-on) using the `set temp_license` CLI command. For more information, refer to the *Infoblox CLI Guide*. Infoblox supports Threat Protection (Software add-on) and Threat Protection Update licenses for elastic scaling. For more information, see *About Elastic Scaling*.

**Note**: You cannot install Multi-Grid Management and Microsoft Management licenses if you install Threat Protection or Threat Protection (Software add-on) licenses on the NIOS appliance.

• **Threat Protection Update**: To receive initial and subsequent threat protection rules and rule updates, you must have the Threat Protection Update license installed. You can then configure NIOS to automatically download and publish threat protection rules or you can manually complete the process. For information, see *Manually Uploading Rulesets* and *Publishing Rule Updates*.

With valid licenses installed, the threat protection appliance can be used as a DNS caching or DNS authoritative server. You can join the appliance to the Grid and treat it as a Grid member. Note that if you install a Threat Protection license on a member, you can enable threat protection only on this member. Contact your Infoblox representative to obtain the Threat Protection, Threat Protection Update and Threat Protection (Software add-on) licenses. For information about licenses, see *Managing Licenses*.

The following table lists all the supported threat protection appliance models and licenses that you can install on them to activate threat protection:

You can install the Threat Protection (Software add-on) license on the following hypervisors:
For more information about these appliances, refer to the respective installation guides under the Tech Docs tab on the Infoblox Support site at https://support.infoblox.com.

Administrative Permissions

Superusers can configure all threat protection related tasks. You can assign Security Permissions to specific admin groups and roles. You can also add a global permission for managing Grid security properties or add an object permission for managing member security properties. To perform any action on the rulesets and rules, you must have a Read-write permission for Grid Security properties and Member Security properties at the Grid level and the member level respectively. For more information about security permissions, see Administrative Permissions for DNS Threat Protection.

Starting and Stopping Threat Protection Service

After you install the Threat Protection licenses on the appliance, you can start the threat protection service so you can monitor and mitigate DNS threats on that appliance.

To start or stop threat protection service:

1. From the Grid tab, select the Grid Manager tab -> Services tab, click the Threat Protection service link, and then select the member check box.
2. From the Toolbar, click Start to start the service or Stop to stop the service.

Note that when you stop threat protection service, the appliance does not provide visibility or protection against network floods or DNS threats. After you enable threat protection service, you can configure rule settings, add custom rules, and evaluate system rules to ensure that mitigation to DNS threats is handled properly. You can also temporary disable the threat protection service when necessary. For information about how to configure Grid security settings, see Configuring Grid Security Properties.

Note: Starting and stopping threat protection service on the Infoblox-4030 Rev-2 appliance may trigger a product restart.

Note that under normal circumstances when the system is not experiencing any attack, enabling the threat protection service may have a significant performance impact. When the system is under attack, enabling the threat protection service may have a higher performance impact. You might also notice a significant increase in the memory usage due to the threat protection service. You cannot replicate Grid, member, and profile level threat protection configuration changes during a scheduled full upgrade.

Enabling and Disabling Monitoring Mode

To ensure that blocking certain DNS queries and packets through threat protection rules does not cause unintended effect on your appliance, you can set the threat protection service in monitor mode. You can also put your appliance in this mode to rule out the possibility that the DNS server is dropping DNS queries. When monitor mode is enabled, the appliance logs DNS packets (instead of dropping them) that would have been blocked by threat protection rules. This information is recorded in the syslog.

When the Threat Protection service is in monitor mode, the service status changes from Threat Protection Service is working to Threat Protection is working in monitor mode and the status color changes from green to yellow. The status appears in both the Data Management tab -> Security tab -> Members tab and in the Grid tab -> Grid Manager tab -> Services tab. Note that when one of the members is in monitor mode, the overall status for the Threat Protection service changes from green to yellow. For more information about viewing service status, see Monitoring Services.

You can enable or disable the monitor mode for individual Grid members through the CLI command set smartnic monitor-mode. You cannot set this configuration at the Grid level. To enable or disable monitor mode for both hardware and Software ADP profiles, you can use the command set adp monitor-mode on/off. The show adp command displays the status of the monitor mode. Grid Manager displays a warning if the threat protection profile is running in monitor mode.

For more information about this command, refer to the Infoblox CLI Guide. Note that the set smartnic monitor-mode command is recorded in the audit log while the threat protection events are recorded in the syslog. For information about the audit log and syslog, see Monitoring Tools.

Understanding Threat Protection Rulesets and Rules

To fully implement Infoblox Advanced DNS Protection, ensure that you import the latest threat protection ruleset. To import rulesets, you must have the Threat Protection Update license installed on the appliance. For more information, see Supported Threat Protection Appliances and Licensing Requirements. A ruleset comprises all threat protection rules, including system and auto-generated rules, rule templates, custom rules (if any), and parameter definitions and values. For detailed information about threat protection rules, refer to the Infoblox Threat Protection Rules available on the Support site. Infoblox supports a common threat protection ruleset for both hardware and Software ADP members. This ruleset supports all rules and templates. You can also manually upload your rulesets or download rulesets automatically from the IT server.

Infoblox Advanced DNS Protection supports the following threat protection rules:

- Predefined system and auto-generated rules, as described in System and Auto Rules.
- Custom rules, as described in Custom Rules.

Each threat protection rule belongs to a rule category. When you import a ruleset, the appliance publishes the system and auto rules in their respective categories. NIOS automatically manages rule categories and you cannot add, delete, or modify them. It also provides rule templates for creating custom rules. During a ruleset update, some categories and rules may be added or removed. These actions are performed without
You can recover only custom rules from the Recycle Bin, if enabled. Rules, rule templates and categories that are removed through rulesets are permanently deleted and cannot be restored from the Recycle Bin.

To obtain initial rules and subsequent rule updates, you can configure the appliance to automatically download and publish rulesets or you can manually download them from the Infoblox Support web site and then publish them. For information about how to configure automatic and manual rule settings, see Configuring Grid Security Properties. Note that only the Grid Master receives rules and rule updates. Grid member receives rules and updates through standard Grid replication from the Grid Master. Ruleset data is not replicated to Grid members that do not have the Threat Protection services enabled. Infoblox recommends that you configure the appliance to automatically receive ruleset updates so your appliance receives the latest rules periodically. If you prefer to manually download and publish rulesets, ensure that you download them frequently to receive the most updated rules. The appliance can store up to nine ruleset versions, and you can select up to five rulesets and switch between these versions for the Grid or members when necessary. For more information about ruleset versions and updates, see About Ruleset Versions and Updates.

Packet Flow for Threat Protection Rules

Threat protection rules are designed to work together to provide maximum protection for your environment. This section describes how these rules are being applied and how you can tune some of them to suit your system setup and network environment. Threat protection rules are grouped by rule categories, and most of them have one or more associated rule parameters. All threat protection rules contain rule parameters that you may or may not be able to configure. Rule parameters are predefined with default values that generally suit most network environments. However, there are times when you have special setups or configurations in your environment that require special attention. In these cases, you may need to change some of the rule parameters to obtain optimal protection without sacrificing system performance. For detailed information about all threat protection rules and how to tune them when necessary, refer to the Infoblox Threat Protection on Rules available on the Support web site. Depending on the rules, you may or may not be able to override default values for the following rule parameters (when applicable):

- **Packets per second**: This parameter defines the rate limit or the number of packets per second that the appliance processes before it performs a triggered action, such as sending warnings or blocking traffic.
- **Drop interval**: This is the time period (in seconds) for which the appliance blocks traffic from the client or traffic that matches a certain pattern beyond the rate limit. Based on how you want to handle the traffic that exceeds the rate limit, you can configure this interval to work with the **Rate Algorithm** parameter.
- **Rate algorithm**: This parameter defines how the appliance handles incoming traffic when the traffic exceeds the rate limit (defined in **Packets per second**). You can set this to "blocking" or "rate limiting." The default is "rate limiting." When you set this to "blocking," the appliance allows client traffic to go through until it hits the rate limit. It then blocks all traffic for the duration of the drop interval. If client traffic continuously exceeds the rate limit, the appliance continues to block all traffic for subsequent drop intervals without letting through any traffic, which could result in an indefinite traffic blockage. When you set this to "rate limiting," the appliance allows client traffic to go through until traffic hits the rate limit. It then blocks all traffic for the rest of the drop interval. The appliance re-evaluates client traffic at the beginning of each drop interval and repeats the same behavior for subsequent intervals.

To avoid resource exhaustion and limit frauds, you can limit the query rate for each source IP, and then set **Drop interval** to one second and **Rate algorithm** to "rate limiting," which results in a rate-limiting behavior that allows some traffic to go through before the rest of the traffic is blocked. In this case, the appliance re-evaluates the client behavior every second. If the client traffic exceeds the rate limit, the appliance processes only queries up to the rate limit and drops all excessive queries for the remainder of the second.

For more information about how to configure **Rate algorithm**, **Packets per second** and **Drop interval**, see Configuration Examples.

**Note:** Starting with NIOS 6.12.4, the default for **Rate algorithm** has been changed from "blocking" to "rate limiting."

- **Events per second**: The number of events logged per second for the rule. Setting a value to 0 (zero) disables the appliance from logging events for the rule. Most rules have this parameter, and the default value is 1.
- **Packet size**: DNS packet size. If the DNS packet size exceeds a certain value, the corresponding rule will be triggered.

Configuration Examples

Depending on how you want the appliance to handle incoming traffic, you can configure applicable parameters so they work hand-in-hand to deliver desired results. Following are some examples that demonstrate how you can use the **Rate algorithm**, **Packets per second** and **Drop interval** parameters.

**Example 1**

If source IP 100.10.10.1 sends queries at a rate of 100 packets per second, and you have the following configuration for a threat protection rule:

- **Packets per second** = 40
- **Drop interval** = 3
- **Rate algorithm** = blocking

The appliance handles incoming traffic in the following manner:
1st second: 40 packets are allowed; all other packets are blocked
2nd second: All traffic from 100.10.10.1 is blocked
3rd second: All traffic from 100.10.10.1 is blocked
4th second: All traffic from 100.10.10.1 is blocked
5th second: All traffic from 100.10.10.1 is blocked
6th second: All traffic from 100.10.10.1 is blocked

In this example, the appliance evaluates historic data of the client behavior. If the client traffic exceeds the limit, then the appliance continuously drops traffic, which may result in an indefinite traffic blockage for a client that continuously violates the rate limit.

Example 2
Source IP 100.10.10.1 sends queries at a rate of 100 packets per second for a duration of two seconds. It then sends 30 packets per second for three seconds and 50 packets afterwards; and you have the following configuration for a threat protection rule:

- **Packets per second** = 40
- **Drop interval** = 1
- **Rate algorithm** = rate limiting

The appliance handles incoming traffic in the following manner:
1st second: 40 packets are allowed; all other packets are blocked for the remainder of the second
2nd second: 40 packets are allowed; all other packets are blocked for the remainder of the second
3rd second: All traffic from 100.10.10.1 is allowed
4th second: All traffic from 100.10.10.1 is allowed
5th second: All traffic from 100.10.10.1 is allowed
6th second: 40 packets are allowed; all other packets are blocked for the remainder of the second

In this case, the appliance re-evaluates the client behavior every second. If client traffic exceeds the rate limit, the appliance processes queries up to the rate limit and drops all excessive queries for the remainder of the second.

About Ruleset Versions and Updates
Infoblox periodically releases updated rulesets. After an automatic update, the new ruleset is automatically applied to the Grid Master and Grid members that are using the Grid ruleset version. After a manual update, you can manually apply the new ruleset to the Grid and individual Grid members. Before you manually publish a ruleset, you can view differences between the current ruleset and the newly downloaded one. You can also modify some changed parameters and then merge the changes from the old version to the new one. For more information, see Comparing and Merging Rulesets.

You can view the current ruleset version (displayed in the Version column) in one of the following tabs:

- **Grid**: From the Data Management tab, select the Security tab -> Threat Protection Rules tab.
- **Member**: From the Data Management tab, select the Security tab -> Members tab.
- **Profile**: From the Data Management tab, select the Security tab -> Profiles tab.

In a Grid, you can run different versions of rulesets on the Grid Master and Grid members. For example, the Grid Master can use revision 1 and a Grid member can use revision 2 of the ruleset. You can also switch back to a previous ruleset version when necessary, but you cannot change the version number for individual rules.

The appliance retains up to nine (9) rulesets at any given time: five (5) old rulesets, one (1) newly downloaded ruleset and three (3) "Do Not Delete" rulesets. You can configure rulesets as "Do Not Delete" at the Grid level. The appliance retains these rulesets and they cannot be deleted during an automatic or manual ruleset update. To allow a ruleset to be deleted during an update, you must first disable the "Do Not Delete" flag for these rulesets. Note that you cannot delete a ruleset that is used by the Grid or any members. For information about how to configure the "Do Not Delete" flag, see Modifying Rulesets.

For more information about how to add, modify, and delete a ruleset, see Managing Threat Protection Rulesets.

Ruleset Update Behavior
Consider the following behavior during a ruleset update:

- If you have configured the rule update policy as Automatic, the following occurs:
  - For each rule that exists in the current ruleset and is used by a Grid member, the appliance automatically copies all customized

Copyright ©2019, Infoblox, Inc. All right reserved.
parameter values from the current ruleset to the corresponding rules in the new ruleset. For rule templates that exist in the current ruleset and are used by any member in the Grid, the appliance automatically copies the rule instances from the current version to the new ruleset.

- The appliance automatically compares and integrates all rule changes into the new ruleset. For manual ruleset update, you can view the differences between the current ruleset and the newly downloaded ruleset, select specific rules and make modifications to customized parameters, and then merge the changes into the new ruleset before applying it to the Grid and members. For more information about how to view the rule differences and merge changes, see Comparing and Merging Rulesets.
- The new ruleset is applied to the Grid and only members that use the same ruleset version as the Grid through inheritance from the Grid security properties. For members that use the same ruleset version as the Grid but have parameter overrides for certain rules, the overridden values will be copied to the new ruleset.

For information about how to configure the rule update policy, see Configuring Grid Security Properties.

- When there are a total of nine (9) rulesets stored in the database, the ruleset that is not used by the appliance and is not marked as "Do Not Delete" will be replaced by the newly downloaded ruleset.
- If there are more than one ruleset that can be replaced, the appliance selects the oldest version based on the version number.
- If a specific system or auto rule from the current ruleset version does not exist in the new ruleset, it will not be migrated to the new ruleset.
- If a specific template from the current ruleset version does not exist in the new ruleset, all of its custom rules will not be migrate to the new ruleset.

### System and Auto Rules

System rules are predefined threat protection rules that are built into the Advance Appliances. New system rules are added through rule updates. You can enable an entire category of system rules as well as individual rules. Note that you cannot add or delete system rules, though you can change some parameters. For most system rules, you can modify the Action and Log Severity. For more information, see Modifying System and Auto Rules.

Auto-generated rules are firewall rules that are automatically defined by NIOS for blocking traffic for disabled services and ports. They do not support functionality such as rate limiting. These rules can be grouped into different rule categories and are enabled or disabled by default. You cannot enable or disable auto rules in this release of Infoblox Advanced DNS Protection, though you can set log severity and control logging for these rules. Note that auto rules are automatically enabled or disabled and reconfigured based on the current running services and configuration on the appliance.

### System and Auto Rule Categories

The appliance supports the following system and auto rule categories. For detailed descriptions about each system and auto rule, refer to the Threat Protection Rules document available on the Infoblox Support site.

- **BGP**: Contains auto rules that mitigate attacks that target BGP (Border Gateway Protocol) routing parameters, such as invalid attribute lengths or invalid message types.
- **DNS Amplification and Reflection**: Contains system and auto rules that can be used to mitigate the commonly used methods of DDoS attacks. For information about DNS amplification and reflection, see DNS Reflection and Amplification Attacks.
- **DNS Cache Poisoning**: Contains rate limiting rules that assign bandwidth restrictions rules used to mitigate DNS cache poisoning (on UDP and TCP) that is performed by sending a large volume of fake replies to a recursive server, which can result in hundreds or thousands of redirects. For more information about DNS cache poisoning, see DNS Cache Poisoning.
- **DNS Malware**: Contains rules that protect against DNS malware that posts serious threats to the DNS infrastructure. For information about DNS malware threats, see DNS Malware.
- **DNS DDoS**: Contains system rules that are used to mitigate DNS DDoS attacks on your Advance Appliance. These rules rate limits clients that trigger following DNS responses: NXDOMAIN, NXRRSET, and SERVFAIL.
- **DNS Message Type**: Contains DNS system rules that can be used to filter requests that query specific DNS flags in the DNS message header.
- **DNS Protocol Anomalies**: Contains auto rules that address general DNS protocol attacks such as invalid DNS queries.
- **DNS Tunneling**: Contains auto rules that mitigate against DNS tunneling attacks. For more information, see Inside-Out Attacks.
- **Default Drop**: Contains system rules that automatically drop IP packets that use unusual UDP, TCP, and ICMP traffic is detected.
- **General DDoS**: Contains auto rules that address general DDoS (Distributed Denial of Service) attacks such as loopback address spoofing, and UDP or TCP packets that contain the same source and destination addresses.
- **HA Support**: Contains auto rules that are used to pass packets that go through the Virtual Router Redundancy Protocol (VRRP) and Internet Group Management Protocol (IGMP) for HA (High Availability) support.
- **ICMP**: Contains auto rules that mitigate ICMP and ICMPv6 ping attacks. ICMP ping size (for IPv4 and IPv6) for these rules is limited to 792 bytes. For information about ICMP, see Internet Control Message Protocol (ICMP) Flood.
- **NTP**: Contains auto rules that mitigate attacks that target the NTP (Network Time Protocol). These rules include support for NTP requests and responses, NTP IPv4 and IPv6 ACLs (Access Control Lists), and private mode 7 packets.
- **OSPF**: Contains auto rules that mitigate attacks that target OSPF (Open Shortest Path First) routing parameters, such as invalid attribute lengths or invalid message types.
- **Potential DDoS Related Domains**: Contains system rules the appliance uses to blacklist domains that may have been the targets or subjects in NXDOMAIN or DDoS attacks. These rules block all FQDN lookups on UDP for domains that have been observed to be used as targets in DDoS attacks, and they are enabled by default.
- **Reconnaissance**: Contains auto rules that mitigate network reconnaissance attacks, in which unauthorized remote attackers attempt to access networks by exploiting network standards and communications.
- **TCP/UDP Floods**: Contains DNS system rules that are used to mitigate DNS TCP and UDP floods. For information about TCP/UDP
Custom Rules

Based on your security needs, you can define custom rules using predefined rule templates. Custom rules are typically whitelisting or blacklisting rules. You can create up to 500 custom rules for each rule template offered by Infoblox Advanced DNS Protection. The appliance logs a syslog message if there are more than 500 rules for a specific rule category. You can remove some rules in order to create new ones for that category.

Note: Before upgrading from an earlier NIOS release to NIOS 6.11.x, ensure that you have less than 500 custom rules for each template. Otherwise, the upgrade may fail.

You can add or delete custom rules for the Grid only. You cannot add or delete them for members, but you can enable, disable, and modify certain rule parameters at the member level.

When you create custom rules, NIOS automatically generates the rule ID from the template used. Note that custom rules do not support IDNs (Internationalized Domain Names). You must first convert IDNs into punycode before entering the data. For information about how to create custom rules, see Creating Custom Rules.

When you create custom rules, you are essentially creating whitelisting and blacklisting entries that utilize rate limiting to detect suspicious UDP and TCP traffic. Infoblox Advanced DNS Protection supports a series of rule templates for defining new custom rules. For information about rule templates, see Custom Rule Templates.

Whitelisting rules define a list of allowed resources before they are blocked by the configured rate limit settings. They provide for only a selected set of entities to access the protected environment. Examples include company offices and their associated internal network services, which presumably uses access control systems to enforce them. In effect, addresses or networks that do not match the whitelisting entries are automatically blocked.

Blacklisting rules define a list of disallowed resources through FQDN lookups as well as rate limiting. Blacklists typically allow a far broader base of access to many more entities, and cite a list of specific entities or people that do not have access. Otherwise, any devices or users theoretically have access to the protected environment.

For whitelist entries, the matching values are mandatory, in which the IP address or network of the rule is expressly permitted access. Blacklist entries are forbidden, in which the IP address or network of the rule is expressly denied access. In essence, blacklisting is more secure.

Note: You can create DNS-specific blacklists under the Data Management tab → DNS tab. However, you cannot use this blacklist feature as part of DNS threat protection.

Custom Rule Templates

Infoblox Advanced DNS Protection supports a few custom rule templates from which you create new custom rules. Note that when you use a specific rule template to create custom rules, the new rules reside in their respective rule categories. For information about creating custom rules, see Creating Custom Rules.

For each rule you create, you can define the Events per second value to determine the number of events per second that will be logged for the rule. You can also define specific rule parameters for custom rules, as follows:

When you create custom rules that involve FQDN lookups, the appliance automatically verifies the FQDN syntax and format that you enter in the Value field. It properly translates escaped sequences and special characters that are used to represent specific characters in the FQDN. For example, \032 is interpreted as a space (hex 20), and " is interpreted as the double quote (hex 22). The appliance sends an error message when it detects invalid characters in the FQDN.

Note: Custom rules do not support IDNs (Internationalized Domain Names). To use IDNs for custom rules, you must first convert the IDNs into punycode. You can use the IDN Converter from the Toolbar for the conversion.

- **BLACKLIST FQDN lookup TCP**: Use this rule template to create custom rules for blacklisting DNS queries by FQDN lookups on TCP. In the Rule Parameters table, complete the following:
  - **Blacklisted FQDN**: Enter the FQDN that you want the appliance to block over TCP traffic. NIOS supports an exact match or subdomain matches for the FQDN specified in the rule. For example, if "test.com" is specified as a custom rule, NIOS blocks "test.com" or "abc.test.com" but "abctest.com" will not be blocked.

- **BLACKLIST FQDN lookup UDP**: Use this rule template to create custom rules for blacklisting DNS queries by FQDN lookups on UDP. In the Rule Parameters table, complete the following:
  - **Blacklisted FQDN**: Enter the FQDN that you want the appliance to block over UDP traffic. NIOS supports an exact match or subdomain matches for the FQDN specified in the rule. For example, if "test.com" is specified as a custom rule, NIOS blocks "test.com" or "abc.test.com" but "abctest.com" will not be blocked.

- **BLACKLIST IP TCP Drop prior to rate limiting**: Use this rule template to create rules for blocking IPv4 or IPv6 addresses on TCP before the appliance drops the packets based on rate limiting rules you have defined using the BLACKLIST IP TCP Drop prior to rate limiting template. In the Rule Parameters table, complete the following:
  - **Blacklisted IP address/network**: Enter the IPv4 or IPv6 address from which packets sent are dropped before any relevant rate limiting rules take effect. Note that all TCP traffic from the specified IPv4 and IPv6 addresses and networks will be blocked. Enter network addresses in address/CIDR format.

- **BLACKLIST IP UDP Drop prior to rate limiting**: Use this rule template to create rules for blocking IPv4 or IPv6 addresses on UDP before the appliance drops the packets based on rate limiting rules you have defined using the BLACKLIST IP UDP Drop prior to rate limiting template. In the Rule Parameters table, complete the following:
• **Blacklisted IP address/network**: Enter the IPv4 or IPv6 address from which packets sent are dropped before any relevant rate limiting rules take effect. Note that all UDP traffic from the specified IPv4 and IPv6 addresses and networks will be blocked. Enter network addresses in address/CIDR format.

• **RATELIMITED FQDN lookup TCP**: Use this template to create custom rules that contains rate limiting restrictions for blocking DNS queries by FQDN lookups on TCP traffic. In the Rule Parameters table, complete the following:
  - **Packets per second**: Enter the number of packets per second to define the rate limit for this rule. You define this value to control the rate of TCP traffic that consists of DNS lookups for the FQDN defined in this rule. The default is 5.
  - **Drop interval**: Enter the number of seconds for which the appliance drops packets.
  - **Blacklist rate limited FQDN**: Enter the FQDN that is affected by the rate limit value configured for this rule. The appliance drops the packets sent by this FQDN when the TCP traffic of DNS lookups for this FQDN exceeds the configured rate limit value.

• **RATELIMITED FQDN lookup UDP**: Use this rule template to create custom rules that contains rate limiting restrictions for blocking DNS queries by FQDN lookups on UDP traffic. In the Rule Parameters table, complete the following:
  - **Packets per second**: Enter the number of packets per second to define the rate limit for this rule. You define this value to control the rate of UDP traffic that consists of DNS lookups for the FQDN defined in this rule. The default is 5.
  - **Drop interval**: Enter the number of seconds for which the appliance drops packets.
  - **Blacklist rate limited FQDN**: Enter the FQDN that is affected by the rate limit value configured for this rule. The appliance drops the packets sent by this FQDN when the UDP traffic of DNS lookups for this FQDN exceeds the configured rate limit value.

**Note**: Make sure that you enter a valid FQDN. Example: test.com, foo.com, etc. The appliance does not display an error message when you enter an invalid FQDN. However, the Threat Protection dashboard displays a warning message for the invalid FQDNs. For information, see Threat Protection Status for Grid.

• **RATELIMITED IP TCP**: Use this rule template to create custom rules that contains rate limiting restrictions for blacklisting IP addresses on TCP. If there are certain IP addresses that you want to block before its traffic reaches the rate limit restrictions, you can create a rule using the RATELIMITED IP TCP template. In the Rule Parameters table, complete the following:
  - **Packets per second**: Enter the number of packets per second to define the rate limit for this rule. You define this value to control the rate of TCP traffic that consists of DNS lookups for the IP address or network defined in this rule. The default is 5.
  - **Drop interval**: Enter the time interval in seconds the appliance drops IP packets sent by the rate limited IP address or network defined for this rule. The default is 30 seconds.
  - **Rate limited IP address/network**: Enter the IP address or network that is affected by the rate limit value configured for this rule. The appliance drops the packets sent by this IP address based on the drop interval when the TCP traffic of DNS lookups for this IP address exceeds the configured rate limit value.

• **RATELIMITED IP UDP**: Use this rule template to create custom rules that contains rate limiting restrictions for blacklisting IP addresses on UDP. If there are certain IP addresses that you want to block before its traffic reaches the rate limit restrictions, you can create a rule using the RATELIMITED IP UDP template. In the Rule Parameters table, complete the following:
  - **Packets per second**: Enter the number of packets per second to define the rate limit for this rule. You define this value to control the rate of UDP traffic that consists of DNS lookups for the IP address or network defined in this rule. The default is 5.
  - **Drop interval**: Enter the time interval in seconds the appliance drops UDP packets sent by the rate limited IP address or network defined for this rule. The default is 30 seconds.
  - **Rate limited IP address/network**: Enter the IP address or network that is affected by the rate limit value configured for this rule. The appliance drops the packets sent by this IP address based on the drop interval when the TCP traffic of DNS lookups for this IP address exceeds the configured rate limit value.

• **WHITELIST IP TCP Pass prior to rate limiting**: Use this rule template to create custom rules for allowing certain IP addresses on TCP before the appliance drops the packets based on rate limiting rules you have defined using the RATELIMITED IP TCP template. In the Rule Parameters table, complete the following:
  - **Whitelist IP address/network**: Enter the IPv4 or IPv6 address from which packets sent are allowed before any relevant rate limiting rules take effect.

• **WHITELIST IP UDP Pass prior to rate limiting**: Use this rule template to create custom rules for allowing certain IP addresses on UDP before the appliance drops the packets based on rate limiting rules you have defined using the RATELIMITED IP UDP template. In the Rule Parameters table, complete the following:
  - **Whitelist IP address/network**: Enter the IPv4 or IPv6 address from which packets sent are allowed before any relevant rate limiting rules take effect.

• **WHITELIST TCP Domain**: Use this rule template to create custom rules to allow DNS queries by FQDN lookups on TCP. In the Rule Parameters table, complete the following:
  - **Whitelist FQDN**: Enter the FQDN that you want the appliance to allow over TCP traffic. NIOS supports an exact match or subdomain matches for the FQDN specified in the rule. For example, if "test.com" is specified as a custom rule, NIOS blocks "test.com" or "abc.test.com" but "abctest.com" will not be blocked.

• **WHITELIST UDP Domain**: Use this rule template to create custom rules to allow DNS queries by FQDN lookups on UDP. In the Rule Parameters table, complete the following:
  - **Whitelist FQDN**: Enter the FQDN that you want the appliance to allow over UDP traffic. NIOS supports an exact match or subdomain matches for the FQDN specified in the rule. For example, if "test.com" is specified as a custom rule, NIOS blocks "test.com" or "abc.test.com" but "abctest.com" will not be blocked.

• **BLACKLIST TCP FQDN lookup for DNS Message Type**: Use this rule template to create custom rules for blacklisting FQDN lookups on TCP for the specified DNS message type. In the Rule Parameters table, complete the following:
  - **DNS Record Type**: Select the DNS record type from the drop-down list or enter a valid ENUM for the DNS record. You can enter a value between 1 and 65534. The following DNS resource records are not supported by this rule template: MD (3), MF (4), MB (7), MG (8), MR (9), WKS (11), HINFO (13), MINFO (14), IXFR (251), and AXFR (252) record.
  - **Blacklisted FQDN substring**: Enter the FQDN from which the packets received are blocked over TCP for the specified DNS message type.

• **BLACKLIST UDP FQDN lookup for DNS Message Type**: Use this rule template to create custom rules for blacklisting FQDN lookups...
Creating Custom Rules

Infoblox Advanced DNS Protection provides a few rule templates from which you can create custom rules. For information about the list of rule templates that you can use, see Custom Rule Templates.

To create a custom rule:

1. From the Data Management tab, select the Security tab -> Threat Protection Rules tab -> Ruleset link, and then click Add Custom Rule from the Toolbar.

2. In the Add Custom Rule editor, complete the following:
   - Template: From the drop-down list, select the blacklisting or whitelisting rule template from which you want to create the new rule. For more information about the rule templates, see Custom Rule Templates.
   - Description: Displays the description of the rule that you are about to create. You cannot modify this.
   - Comment: Enter comments to describe the new rule.
   - Disable: Select this if you want to keep the new rule disabled for later use.

3. Click Next and complete the following to configure rule parameters:
   - Description: Displays the description of the rule that you are about to create. You cannot modify this.
   - Action: Displays the operation the appliance performs when an event related to this rule occurs. Some rules are restricted to specific actions. For example, the action for all blacklisting rules is set to Drop, where the appliance drops IP packets when such an event occurs. The action for all whitelisting rules is set to Pass, where the appliance passes IP packets when such an event occurs.
   - Log Severity: Select Critical, Major, Warning or Informational. The log severity you select here determine the severity of the message triggered by a match against the rule.

In the Rule Parameters section, do the following:

- **DNS Record Type**: Select the DNS record type from the drop-down list or enter a valid ENUM for the DNS record. You can enter a value between 1 and 65534. The following DNS resource records are not supported by this rule template: MD (3), MF (4), MB (7), MG (8), MR (9), WKS (11), HINFO (13), MINFO (14), IXFR (251), and AXFR (252) record.
- **Blacklisted FQDN substring**: Enter the FQDN from which the packets received are blocked over UDP for the specified DNS message type.
- **Pass TCP DNS Message Types**: Use this rule template to create custom rules to allow TCP DNS packets that contain the specified DNS record type. In the Rule Parameters table, complete the following:
  - **DNS Record Type**: Select the DNS record type from the drop-down list or enter a valid ENUM for the DNS record. You can enter a value between 1 and 65534. The following DNS resource records are not supported by this rule template: MD (3), MF (4), MB (7), MG (8), MR (9), WKS (11), HINFO (13), MINFO (14), IXFR (251), and AXFR (252) record.
- **Pass UDP DNS Message Types**: Use this rule template to create custom rules to allow UDP DNS packets that contain the specified DNS record type. In the Rule Parameters table, complete the following:
  - **DNS Record Type**: Select the DNS record type from the drop-down list or enter a valid ENUM for the DNS record. You can enter a value between 1 and 65534. The following DNS resource records are not supported by this rule template: MD (3), MF (4), MB (7), MG (8), MR (9), WKS (11), HINFO (13), MINFO (14), IXFR (251), and AXFR (252) record.
- **RATE LIMITED TCP DNS Message Type**: Use this rule template to create custom rules that contain rate limiting restrictions for blacklisting TCP DNS packets that contain the specified DNS record type. In the Rule Parameters table, complete the following:
  - **Packets per second**: Enter the number of packets per second to define the rate limit for this rule. You define this value to control the rate of TCP traffic that consists of DNS packets with the DNS record type defined in this rule. The default is 5.
  - **DNS Record Type**: Select the DNS record type from the drop-down list or enter a valid ENUM for the DNS record. You can enter a value between 1 and 65534. The following DNS resource records are not supported by this rule template: MD (3), MF (4), MB (7), MG (8), MR (9), WKS (11), HINFO (13), MINFO (14), IXFR (251), and AXFR (252) record.
  - **Drop interval**: Enter the number of seconds for which the appliance drops packets.
- **RATE LIMITED UDP DNS Message Type**: Use this rule template to create custom rules that contain rate limiting restrictions for blacklisting UDP DNS packets that contain the specified DNS record type. In the Rule Parameters table, complete the following:
  - **Packets per second**: Enter the number of packets per second to define the rate limit for this rule. You define this value to control the rate of UDP traffic that consists of DNS packets with the DNS record type defined in this rule. The default is 5.
  - **DNS Record Type**: Select the DNS record type from the drop-down list or enter a valid ENUM for the DNS record. You can enter a value between 1 and 65534. The following DNS resource records are not supported by this rule template: MD (3), MF (4), MB (7), MG (8), MR (9), WKS (11), HINFO (13), MINFO (14), IXFR (251), and AXFR (252) record.
  - **Drop interval**: Enter the number of seconds for which the appliance drops packets.
alue field. It properly translates escaped sequences and special characters that are used to represent specific characters in the FQDN. For example, ‘\32’ is interpreted as a space (hex 20), and ‘\u’ is interpreted as the double quote (hex 22). The appliance sends an error message when it detects invalid characters in the FQDN.

4. Click Save & Close.

The new rule, with an automatically assigned rule ID, is created and placed in its corresponding rule category.

Using the Events Per Second Rule Setting

The Events per second setting allows for disabling or throttling of event logs for specific threat protection rules.

Setting the Events per second parameter to zero disables logging for that rule. Setting the parameter to any other number enables threat protection logging for that specific rule. For information about how to configure this, see Configuring Grid Security Properties.

Configuring Grid Security Properties

After you have installed valid threat protection licenses, you can configure rule update settings for the Grid. The Grid settings apply to all members in the Grid. You can select to use an existing threat protection ruleset or use a threat protection profile. A threat protection profile defines specific security settings and ruleset that you want to apply to a specific member or a group of members. For more information about rulesets, see Unders toling Threat Protection Rulesets and Rules. For information about threat protection profiles, see Configuring Threat Protection Profiles. You can override only the global Event per second filter (in the Basic tab) and the Disable multiple DNS requests via single TCP session option (in the Advanced tab) in the Member Security Properties editor by selecting a member and clicking Edit.

To configure rule settings for the Grid or an individual member:

1. Grid: From the Data Management tab, select the Security tab, and then click Grid Security Properties from the Toolbar.
2. In the Grid Security Properties editor, select the Threat Protection tab -> Basic tab, and complete the following:
   - **Active Ruleset Version:** To activate and apply a specific ruleset to the Grid, select the ruleset from the drop-down list.
   - **Active Ruleset Comment:** Displays information about the selected ruleset from the Comment field of the ruleset.

In the Threat Protection Rulesets Updates section, define the rule update policy. The appliance automatically performs rule updates by default. You can choose to manually publish rule updates. For information about how to manually publish rule updates, see Manually Uploading Rulesets and Publishing Rule Updates.

   - **Latest Available Ruleset:** Displays the version string of the last published ruleset. This field changes each time when the ruleset is updated.
   - **Last Checked For Updates:** Displays the timestamp and time zone when you manually upload a ruleset file or automatically download the latest rule update file from the Infoblox rule update server. This field changes the timestamp only when there is a change in the ruleset. The appliance does not update this field if there is no change in the ruleset for the manual upload or automatic download.
   - **Rule Update Policy:** Select the rule update policy from the drop-down list to determine whether updates are being applied automatically or manually. When you select Automatic, the appliance automatically switches to the newly downloaded ruleset and publishes the changes when a ruleset update is applied. Select Manual to manually download updated rulesets and publish them. Note that you must have a valid Threat Protection Update license installed in order to perform ruleset updates. For information about how to perform a manual update, see Manually Uploading Rulesets and Publishing Rule Updates.
   - **Enable Automatic Ruleset Downloads:** Select this to enable automatic ruleset downloads. Note that starting with NIOS 8.0.0, ruleset downloads might take longer than previous releases; but there is no functional impact during the downloads.

**Note:** When you select this, ensure that you configure and enable a valid DNS resolver for the Grid in the Grid Properties editor so the appliance can successfully access the updated ruleset file.

If your network environment does not allow direct HTTP or HTTPS communication with the Internet through a firewall from a secure location in which the Grid Master or the standalone appliance resides, you can configure the Advance Appliance to use a proxy server so you can receive automatic threat protection updates through this connection. Configured proxy settings are for the entire Grid. You cannot configure proxy settings for individual members. For information about how to configure proxy servers, see Configuring Proxy Servers.

   - **Test Connection:** Click this to test the connectivity between the Advance Appliance and the server from which you receive the rule update files. Grid Manager displays a message indicating whether the connection is successful.
   - **Download Rules Now:** Click this to immediately download the latest rule update file from the Infoblox rule update server, provided that the connection between the appliance and the server is successful.

In the Schedule section, define the schedule for automatic ruleset downloads. The following options are enabled only when you have selected Enable Automatic Ruleset Downloads:

   - **Default:** Select this to set the default schedule settings for automatic ruleset downloads.
   - **Custom:** Select this to schedule downloads at a later date and time. Click the Calendar icon to select the date and time.

**Note:** When you schedule automatic ruleset downloads, the downloads are performed within 15 minutes before or after the scheduled time. If you have multiple Grid members configured for downloads, the same offset time applies to all members when the first member is unreachable. Downloads to the next reachable member do not happen right after a download fails on the unreachable member. The offset time is put in place to prevent all members from performing downloads at the same time.

In the Threat Protection Logging section, define the events per second per rule value to allow the appliance to log events in the syslog:
• **Events per Second per Rule:** Specify the number of events logged per second per rule. The default value is one and the maximum value is 700. Setting the value to 0 (zero) disables the appliance from logging events for the rules. The appliance displays an error message when you enter a value greater than the maximum value. You can override this event filter at the member level.

3. Save the configuration. To publish changes, click **Publish** if it appears at the top of the screen. Note that NIOS does not require restarting of the threat protection service after rule updates.

### Enabling Multiple DNS Requests through a Single TCP Session

The Advance Appliance inspects only one DNS request sent over a single TCP connection. To avoid accepting possible malicious data following a valid DNS request, the appliance terminates the TCP connection after handling the initial DNS request over TCP. You can modify this default Grid setting at the Grid or member level. To modify this setting, do the following:

1. **Grid:** From the **Data Management** tab, select the **Security** tab, and then click **Grid Security Properties** from the Toolbar. **Member:** From the **Data Management** tab, select the **Security** tab -> **Members** tab -> **member** check box, and then click the **Edit** icon. **Profiles:** From the **Data Management** tab, select the **Security** tab -> **Profiles** tab -> **profile** check box, and then click the **Edit** icon.

2. In the **Grid Security Properties** or **Member Security Properties** editor, select the **Threat Protection** tab -> **Advanced** tab, and complete the following:

• **Disable multiple DNS requests via single TCP session:** This is selected by default to avoid accepting possible malicious data following a valid DNS request. When this is selected, the appliance handles the initial DNS request through TCP and then terminates the TCP session to block subsequent DNS traffic, except for an SOA query sent by a client that is accepted in the allow-transfer ACL. This exception covers the case in which an AXFR query follows the SOA query through the same TCP connection. This field is read-only when you use a threat protection profile instead of a ruleset. For more information, see Configuring Grid Security Properties.

3. Save the configuration.

### Configuring NAT Mapping Properties

If you are operating in an environment where you need to aggregate multiple users (such as mobile users) behind one IP address, you might want to consider using NAT (Network Address Translation) Mapping to avoid the potential of service denial to a large group of users if threat protection rules are being applied to the same IP address.

NAT detection is essential to enforce the correct threat protection rule on source IP addresses. The Infoblox NAT Mapping feature allows you to designate individual IP addresses, networks, or ranges along with the source port ranges to denote NAT’ed clients. Any UDP or TCP traffic that originates from an IP address within the NAT IP range and uses a source port within the NAT port mapping is considered as a NAT’ed client. It is important to align the NIOS NAT mapping configuration with the NAT gateway configuration to avoid mis-classification of NAT IPs. Traffic that originates from a given source port block that falls within the configured NAT IP and port range is considered as the same NAT’ed client and traffic that originates from a different port block that falls within the same NAT IP and port range is considered to be a different NAT’ed client. If the traffic originates from the same source IP address, but from a different port block that falls outside the configured port range, then they are considered as a non-NAT’ed client.

NIOS NAT detection is designed to work with a specific form of NAT where multiple clients are NAT’ed onto a single public IP address using a single port block for each client at a time. Some NAT vendors refer to this scheme as PBA (Port Block Allocation) with fixed size port blocks. The NAT device cannot re-use the same NAT IP address for a different client for at least the drop interval of the threat protection rule that is currently running. Note that the client idle timeout duration of the NAT device must be larger than the drop interval of the threat protection rule that is currently running.

You can configure NAT Mapping rules on Advance Appliances by mapping a source IP address, network, or range of IP addresses with a range of ports and specifying the port block size to divide each port range into chunks of port blocks. Each port block represents a single NAT’ed client source port. The IP addresses and the port blocks specified in a NAT Mapping rule may be assigned to the clients in any order, either fixed, sequential, or random.

The appliance logs information about NAT’ed clients to the syslog. Following is an example of the threat detection event log message in the syslog for NAT’ed clients:

```
2015-06-01T22:57:22+00:00 daemon infoblox.localdomain threat-protect-log[12192]: err
CEF:0|Infoblox|NIOS Threat|7.2.0-283371|120303001|Blacklist:block.com|7|src=3.0.0.100
spt=1221 dst=1.1.6.2 dpt=53 act="DROP" cat="BLACKLIST UDP FQDN lookup" nat=1 nfpt=1124
nlpt=1223
```

The following values in the threat detection event log message are specific for NAT’ed clients:

- **nat=1:** Indicates that the syslog event is logged for a NAT’ed client.
- **nfpt:** Indicates the first port in the port block.
- **nlpt:** Indicates the last port in the port block.

For information about the syslog and how to use it, see Viewing the Syslog. Note the following about the NAT Mapping feature:

- A single NAT’ed client cannot use multiple source IP addresses or multiple port blocks simultaneously, otherwise NIOS might consider the same NAT’ed client as different clients.
You can enable the NAT Mapping feature and configure NAT Mapping rules on the Infoblox-4030 Rev-2, Infoblox-4030 10GE appliances and the following hardware-based appliances: PT-1400, PT-1405, PT-2200, PT-2205, PT-2205-10GE, PT-4000, and PT-4000-10GE. Note that you can enable this feature only when threat protection service is enabled on the appliance.

Configuring NAT Mapping Rules

To enable the NAT Mapping feature and to configure NAT Mapping rules for a Grid or a member:

1. **Grid**: From the Data Management tab, select the Security tab, and then click Grid Security Properties from the Toolbar.
   
   **Member**: From the Data Management tab, select the Security tab -> Members tab -> member check box, and then click the Edit icon.

2. In the Grid Security Properties or Member Security Properties editor, select the NAT Mappings tab -> Basic tab, and then complete the following:

   The member inherits the NAT mapping settings from the Grid, by default. To override the settings, click Override. To retain the same settings as the Grid, click Inherit. Note that if you choose to override the Grid settings, you must override the entire setting; you cannot override partial setting.

   - **Enable tracking for NAT mappings**: This check box is disabled by default. When you select this check box, you can configure certain addresses, networks, and ranges for NAT tracking. When the NAT Mapping feature is enabled or disabled for the Grid, all members in the Grid inherit this setting.
   - **NAT Mappings**: To define the NAT Mapping rule, click the Add icon and select one of the following:
     - **Address**: Select this to configure a single NAT address. For example, if you have only one single NAT client or a single NAT source IP, select this.
     - **Network**: Select this if you want to configure an entire subnet for NAT.
     - **Range**: Select this if you want to configure a partial subnet for NAT.

After you select the NAT mapping type, the appliance adds a new row to the table and displays the type in the table (you cannot modify this in the table). In the Address/Network/Range column of the new row, enter a single NAT address, if you have selected Address. You can also configure a network address as a single NAT address. Enter a subnet if you have selected Network; or enter the partial subnet if you have selected Range. Note that IPv6 address, network, or range entry is not supported.

Click + beside the NAT mapping type, and then click the cell of the following fields in the new row to enter information:

- **Start Port**: Enter the first source port in the port range. For example, if the port range is 1000-2000, you can enter 1000 as the start port.
- **End Port**: Enter the end source port in the port range. For example, if the port range is 1000-2000, you can enter 2000 as the end port.
- **Block size**: Enter the port block size. This determines the number of port blocks and each port block is considered as a logical NAT client. Based on the port block size, the port range is divided into port blocks. For example, if the start port is 1000 and the end port is 2000, and if you enter the port block size as 100, then 1000-1099 is the first port block, 1100-1199 is the second port block, 1200-1299 is the third port block, and so on.

You can create a separate NAT Mapping rule for each source IP address, network, or range. You can add a maximum of 32 NAT Mapping rules and a maximum of 32 port ranges for each rule.

**Note**: The combination of the source IP address, network, or range and the port blocks configured for each NAT'ed client must be unique and it should not overlap.

3. Save the configuration.

**Note**: If you change the NAT Mapping rule after you have configured the NAT Mapping rule or if you enable or disable the NAT Mapping feature, you must publish the changes by clicking Publish Changes from the Toolbar. For information, see Publishing Rule Updates.

Managing Threat Protection Rulesets

You can do the following after the initial setup, including uploading the initial ruleset:

- Review the list of threat protection members, as described in Listing Members.
- Look at rulesets that are currently installed on your system, as described in Viewing Threat Protection Rules.
- Upload new rulesets to the system when you have selected to manually apply rule updates, as described in Manually Uploading Rulesets.
• Publish rule updates that you have uploaded to the system, as described in Publishing Rule Updates.
• Modify the Comment and Do Not Delete parameters for an existing ruleset, as described in Modifying Rulesets.
• View differences between an old and a new rulesets and optionally merge rule parameter changes from the old ruleset into the new one, as described in Comparing and Merging Rulesets.
• Configure proxy settings for the Grid if you need to use a proxy server for ruleset updates, as described in Configuring Proxy Servers.
• Delegate ruleset updates to a Grid member and select an alternate interface for downloading the updates, as described in Configuring Members and Interfaces for Automatic Updates.

Listing Members

This panel displays the following information about each Grid member:

• Name: The hostname of the Grid member.
• Status: The status of the DDoS service running on the Grid member.
• Version: Displays the threat protection ruleset version that is currently running on this member. This is displayed in YYYYMMDD-x format, where YYYY is the year, MM the month, DD the date, and x the rule engine version number.
• Comment: Comments that were entered for the Grid member.
• Profile: Displays the threat protection profile that is associated with this member.
• Site: Values that were entered for this pre-defined attribute. You can do the following:
  • Sort the data in ascending or descending order by column.
  • Select a member and click the Edit icon to modify the data.
  • Click the Action icon next to the respective member and:
    • select Permissions from the menu to define permissions for the member.
    • select Clone to new profile from the menu to create a new threat protection profile by cloning the settings from a member to the new profile. Note that this option is enabled only when the selected member is not associated with a profile.
  • Print and export the data in this tab.
  • Use filters and the Go to function to narrow down the list. With the autocomplete feature, you can just enter the first few characters of an object name in the Go to field and select the object from the possible matches.
  • Create a quick filter to save frequently used filter criteria:
    a. In the filter section, click Show Filter and define filter criteria for the quick filter.
    b. Click Save and complete the configuration In the Save Quick Filter dialog box.

The appliance adds the quick filter to the quick filter drop-down list in the panel. Note that global filters are prefixed with [G], local filters with [L], and system filters with [S].

Viewing Threat Protection Rulesets

Grid Manager displays all the rulesets that have been automatically or manually uploaded to the Grid Master. You can drill down to each ruleset to review individual rules in each rule category. To view the current threat protection rulesets and rules:

   Profile: From the Data Management tab, select the Security tab -> Profiles tab -> profiles link.
2. In the Threat Protection Rules or the Members tab or the Profiles tab, Grid Manager displays current rulesets that are stored in the system. It displays the following information for each ruleset:

   • Version: Displays the ruleset version in YYYYMMDD-x format, where YYYY is the year, MM the month, DD the date, and x the rule engine version number. You can click a version link to view rule categories and individual rules in each category for that specific ruleset.
   • Active On: Displays the Grid or the name of the Grid member on which the ruleset is currently running. This can be Grid, a Grid member name, or None. When this displays None, the ruleset is not being used.
   • Do Not Delete: Indicates whether this ruleset can be deleted or not during a ruleset update.
   • Added On: Displays the timestamp when the ruleset was uploaded to the Grid Master in this format: YYYY-MM-DD HH:MM:SS, plus time zone.
   • Add Type: Indicates whether the ruleset was uploaded automatically or manually.
   • Comment: Additional information about this ruleset.

Note: If the member is associated with a profile, the rules become read-only and you cannot edit them when you drill down the ruleset from the Members tab. However, you can still edit the rules if you drill down the ruleset from the Profiles tab even though Grid members are associated with the selected profile.

You can also do the following when you left click the Action icon
Mark a ruleset as do not delete.
Activate, open, or edit a specific ruleset.
Click **Reset to defaults** to globally reset all the rule definitions to their default settings in the selected ruleset. When you reset the ruleset to defaults, all member rulesets will be reset as well. In the **Ruleset Reset** dialog, you can also select **Delete all custom rules in selected ruleset** to remove all the custom rules in the ruleset. You can reset to defaults at the rule category and rule levels. Note that the **Reset to defaults** option is not available if you upgrade to NIOS 7.3.x from a previous release.

To view rules in a specific ruleset version, click the **Version** link and Grid Manager displays the threat protection rules by categories. You can also select the check box of a ruleset and click the **Open** icon to view the rules in the ruleset.

You can also do the following in this panel:

- Manually upload a ruleset by clicking the **Add** icon. For more information, see **Manually Uploading Rulesets**.
- Modify some of the data in the table. Double click a row, and you can modify the **Do Not Delete** and **Comment** columns. Click **Save** to save the changes. Note that other fields are read-only.
- Select the check box of a ruleset and click the **Delete** icon to delete a ruleset, if it is not marked as **Do Not Delete**.

**Note:** When you delete a ruleset that was recently downloaded through automatic downloads, the appliance cannot retrieve or automatically download this ruleset version again. You must manually download the ruleset and then manually deploy it to the Grid. For information about manual downloads, see **Manually Uploading Rulesets**.

- Print or export the data.

Activating a Ruleset

The appliance can store up to nine (9) versions of rulesets. You can switch between these versions and activate one of them as the default ruleset.

To activate a specific ruleset:

1. **Grid:** From the **Data Management** tab, select the **Security** tab -> **Threat Protection Rules** tab.
   
   **Member:** From the **Data Management** tab, select the **Security** tab -> **Members** tab -> **member link.**

2. In the Grid Threat Rulesets or Member Rulesets table, click the **Action** icon and select **Activate** from the menu. In the confirmation dialog, select **Yes** to proceed. The appliance installs the ruleset and uses it as the default ruleset for the Grid or the member.

Overriding the Grid Ruleset

You can override the Grid ruleset for individual members. Note that when a member uses a different ruleset than the Grid, it does not receive a ruleset update if the Grid automatically receives the next update. For information about how to activate a ruleset for the Grid, see **Configuring Grid Security Properties**.

To override the Grid ruleset:

1. From the **Data Management** tab, select the **Security** tab -> **Members** tab -> **member** check box, and then click the **Edit** icon.

2. In the **Member Security Properties** editor, select the **Threat Protection** tab -> **Basic** tab, and complete the following:
   - **Use ruleset:** Click this radio button to edit the ruleset. You can inherit or override a ruleset. When you select to use a ruleset, select an active ruleset from the **Threat Protection Ruleset Version** drop-down list.
   - **Use profile:** Click this radio button to edit the threat protection profile. Click **Select Profile** to select a threat protection profile from the **Threat Protection Profile Selector** dialog box. For more information about threat protection profiles, see **Adding Threat Protection Profiles**.
   - **Active Ruleset Version:** Click **Override** and select a ruleset from the drop-down list. The appliance activates and applies this ruleset to the member. In the confirmation dialog, click **Yes** and the member switches to the selected ruleset. This field is read-only at the member level.
   - **Active Ruleset Comment:** Displays information about the selected ruleset from the **Comment** field. This field is read-only at the member level.

Modifying Rulesets

To modify parameters for an existing ruleset:

1. From the **Data Management** tab, select the **Security** tab -> **Threat Protection Rules** tab.

2. In the Grid Threat Ruleset table, select the ruleset check box, and then click the **Edit** icon.

3. In the **Threat Ruleset** editor, select the **General** tab -> **Basic** tab to modify the following:
• **Comment**: Enter information about the ruleset.
• **Mark as Do Not Delete**: When you select this, the ruleset cannot be deleted during an update. You can select up to three rulesets and mark them as **Do Not Delete**.

You can also view the following information (but you cannot modify it):

• **Version**: Displays the ruleset version in YYYYMMDD-x format, where YYYY is the year, MM the month, DD the date, and x the ruleset engine version number.
• **Active On**: Displays the Grid or the name of the Grid member on which the ruleset is currently running. This can be **Grid**, a Grid member name, or **None**. When this displays **None**, the ruleset is not being used.
• **Added On**: Displays the timestamp when the ruleset was uploaded to the Grid Master in this format: YYYY-MM-DD HH:MM:SS, plus time zone.

### Comparing and Merging Rule Sets

After you manually download a ruleset and before you publish it, you can view differences between the old ruleset and the new one. The appliance shows you the system-level changes, including new rules, deleted rules, and rule syntax, between the two rulesets. It also shows you the customized parameter changes between the two versions. You can then select the changes you want to merge into the new ruleset. You can also modify some of these customized changes before you merge them into the new ruleset. Note that the modifications you make to the customized rule parameters will be added only to the new ruleset. When merging rulesets, all rules in the old ruleset and new ruleset are compared and identified by their rule IDs.

To merge rules from an older ruleset version to a newer ruleset:

1. From the **Data Management** tab, select the **Security** tab -> **Threat Protection Rules** tab, click **Merge** from the Toolbar, and then select **Ruleset** from the drop-down list.
2. In the **Merge Changes Into Ruleset** editor, complete the following:
   • **Old Ruleset**: From the drop-down list, select the ruleset version from which you want to merge changes into the new ruleset. The **Comment** field displays additional information about the ruleset.
   • **New Ruleset**: From the drop-down list, select the ruleset version to which you want the changes to be merged. The **Comment** field displays additional information about the ruleset.
   • **Get Differences**: Click this to display a list of differences between the selected old and new ruleset versions. The appliance displays system-level changes in the **System changes from old ruleset (x items)**, where x is the total number of changed rules between the old and new rulesets. The appliance merges all system-level changes listed in this table into the new ruleset.

The table displays the following information for each changed rule:

• **Rule ID**: The rule ID of the changed rule. You can click the rule link and modify parameters in the rule editor.
• **Rule Name**: The name of the rule.
• **Type**: Indicates whether the rule is a newly added rule or it has been deleted.
• **Old Ruleset Value**: Displays the old value that has been changed.
• **New Ruleset Value**: Displays the newly changed value.

The **Customizations from old ruleset (x items)** table displays customized rule parameter changes between the old and new rulesets, where x is the total number of changed rules. You can select all or specific changed rules in this table to be merged into the new ruleset. You can also modify parameter for selected rules before merging the changes into the new ruleset. This table displays the following information for each rule:

• **Member**: The Grid member on which this rule is currently running.
• **Rule ID**: The rule ID of the changed rule. You can click the rule link and modify parameters in the rule editor.
• **Rule Name**: The name of the rule.
• **Old Ruleset Value**: Displays the old value that has been changed.
• **New Ruleset Value**: Displays the newly changed value.
• **Action**: Displays what the appliance will do to changes in this rule when you merge the rulesets.

3. Click **Merge Changes** to copy all the selected rules and changes you made to specific rules to the new ruleset. Note that you must select a rule from the **Customizations from old ruleset (x items)** table to activate the merging operation.

You can do the following in the **Merge Changes Into Ruleset** editor:

• Click Export to export all the changes listed in both tables to one CSV file. You can export this data after you click **Get Differences** and Grid Manager displays changes in both tables.
• Perform another ruleset merge by selecting another old ruleset and new ruleset.
• Click Close to exit the editor. Note that the editor does not close automatically after a merge.

### Manually Uploading Rulesets

You can download a threat protection ruleset any time when you select to manually perform ruleset updates. You can choose to download rule updates but not immediately deploy them. NIOS archives and tracks up to nine ruleset versions, allowing for switching and merging between these versions when necessary. After uploading a ruleset, you can apply it by publishing it to the Grid and individual members. For more information, see the NIOS Administrator Guide.
information, see Publishing Rule Updates.

Ruleset updates do not require restart of the DNS or threat protection service in the Grid, and they do not affect ongoing services. However, the appliance deploys updated rulesets only when you publish the changes. Note that all threat protection rule update events are logged in the syslog on the Grid Master only.

Note: By default, threat protection ruleset updates are automatic. Infoblox recommends that you retain this setting. For information about how to configure this setting, see Configuring Grid Security Properties.

To manually upload a ruleset file:

1. Access the Infoblox KB article # 2646 by logging in to the Infoblox Support site at https://support.infoblox.com, and then download the ruleset file in the KB article.
2. From the Data Management tab, select the Security tab -> Threat Protection Rules tab, and then click the Add icon.
3. In the Rule File Upload dialog box, do the following:
   - File: Click Select to navigate to the ruleset file location, and then click Upload. Grid Manager displays the file name in this field.
   - Click Test to check the changes that will occur during the rule update, without actually applying the update. You can view the update details in the Syslog Viewer. The appliance preserves the uploaded file if you do not click Update to update the rules. When you manually upload rulesets the next time, this file will be displayed in the dialog. You can then choose to apply the update from this file or upload a new file before performing the update.
   - Click Update to update the rules.
   - Click View Update Results to view the updated rules in the Syslog Viewer. All threat protection rule updates are logged in the syslog on the Grid Master.

Publishing Rule Updates

You can publish rule updates at any time after you have uploaded the ruleset. For information about uploading ruleset files, see Manually Uploading Rulesets.

To publish rule updates:

1. From the Data Management tab, select the Security tab -> Threat Protection Rules tab, and then click Publish Changes from the Toolbar.
2. In the Publish Changes dialog box, complete the following:
   - Publish Changes on all Members: Select one of the following:
     - Simultaneously: Publish changes on all of the members in the Grid at the same time.
     - Sequentially: Publish changes on each Grid member according to the number of seconds you enter in the Sequential every (seconds) field. For example, if you enter every 10 seconds, the system update changes on the first member, and 10 seconds later on the second member. This is the default option.
   - Impacted Members and Services: Click the Poll Members icon to display the affected members in that Grid. Grid Manager displays the member names and whether each member is configured for the threat protection service:
     - Yes: The service is active and the system will publish rule updates on this member upon execution of this task.
     - No: The service is not active and the system will not publish rule updates on this member.
     - Disabled: The service is currently disabled on this member.

To schedule this task, click the Schedule icon at the top of the dialog box. In the Schedule Change panel, complete the following:

   - Now: Publish rule updates upon clicking Publish.
   - Later: Enter the following information to schedule publishing updates at a certain date and time:
     - Start Date: Enter a date in YYYY-MM-DD (year-month-day) format. The appliance displays today’s date. You can also click the calendar icon to select a date from the calendar widget.
     - Start Time: Enter a time in hh:mm:ss AM/PM (hours:minutes:seconds AM or PM) format. When you enter the time in a 24-hour format such as 23:00, Grid Manager displays 11:00:00 PM. You can also select a time from the drop-down list by clicking the time icon.
     - Time Zone: Select a time zone for the scheduled date and time from the drop-down list. This field displays the time zone of the browser that the admin uses to log in to Grid Manager.

3. Click Publish to publish changes immediately or click Schedule Publish to schedule the publish.

Delegating Rule Updates to Grid Members

You can delegate ruleset updates to other Grid members if desired. You can also configure the interface you want to use for automatic updates on the members. For information about how to configure this, see Configuring Members and Interfaces for Automatic Updates.

Configuring Threat Protection Profiles

When you configure the Grid or Member security properties, you have an option to select an active ruleset or a threat protection profile. A threat protection profile defines specific security settings and ruleset that you want to apply to a specific member or a group of members. Infoblox uses event filters to limit the amount of logs that are generated due to the threat protection events. It drops packets for services or ports that are not
enabled on the card.
If you want to use the same threat protection rulesets and settings for multiple members, you can create a threat protection profile and associate it with multiple members so you do not have to configure them individually. You can configure threat protection profiles for both hardware and Software ADP appliances. Infoblox automatically migrates threat protection profile settings when:

- you update an active ruleset at the Grid level and if a profile has inherited the respective active ruleset from the Grid.
- the profile inherits an active ruleset from the Grid and you override the active ruleset that is associated with the profile.
- the profile is set to override an active ruleset and you change an active ruleset for the profile.

You can do the following to configure threat protection profiles:

- Create threat protection profiles by associating rulesets, event filters and configuring multiple DNS requests over a single TCP session, as described in **Adding Threat Protection Profiles**.
- Clone threat protection profiles, as described in **Cloning Threat Protection Profiles**.
- Modify threat protection profiles, as described in **Modifying Threat Protection Profiles**.
- View differences between an old and a new rulesets and merge changes from an old threat protection profile into the new one, as described in **Merging Threat Protection Rulesets and Rules**.
- Inherit Grid rule settings for a threat protection profile, as described in **Inheriting Grid Rule Settings**.
- Delete a threat protection profile, as described in **Deleting Threat Protection Profiles**.
- View the list of threat protection profiles, as described in **Viewing Threat Protection Profiles**.

### Adding Threat Protection Profiles

You can create a threat protection profile and associate an active ruleset with it. Infoblox supports common threat protection rulesets for both hardware and Software ADP members. You can either upload a ruleset or download rulesets from a server. You can create any number of threat protection profiles, but you can select only a maximum of five rulesets in combination at the Grid, member and profile levels. For more information about rulesets, see **Understanding Threat Protection Rulesets and Rules**.

The threat protection profile allows you to create your own set of rules for either a member or a group of members that experience a similar kind of traffic. After you define a profile, you can clone it and test the copied settings for a new ruleset on one member before publishing the changes for a group of members that are associated with the profile.

To define threat protection profiles:

1. From the **Data Management** tab, select the **Security** tab -> **Profiles** and then click the **Add** icon.
2. In the **Add Threat Protection Profile Wizard**, add the following:
   - **Name**: Enter a name for the threat protection profile.
   - **Comment**: Enter information about the threat protection profile.
   - **Active Ruleset Version**: Select a value from the drop-down list. This indicates the current ruleset that is used for the respective threat protection profile. If you inherit a ruleset from the Grid and later change the respective ruleset at the Grid level, the new ruleset is not reflected in the profile. You must manually change the selected ruleset for the profile. For more information about active rulesets, see **Understanding Threat Protection Rulesets and Rules**.
   - **Active Ruleset Comment**: Click **Override** to override the comment.
   - **Events per Second per Rule**: Click **Override** to override the values. This indicates the number of events that is logged per second per rule to allow the appliance to log events to the syslog. Specify the number of events logged per second per rule. The default value is one and the maximum value is 700. Setting the value to 0 (zero) disables the appliance from logging events for the rules. The appliance displays an error message when you enter a value greater than the maximum value. You can override this event filter at the member level. For more information, see **Using the Events Per Second Rule Setting**.
   - **Disable multiple DNS requests via single TCP session**: Click **Override** to override the values. This determines if multiple DNS responses through TCP connection are disabled. For more information, see **Enabling Multiple DNS Requests through a Single TCP Session**.

   **Note**: A member associated with a threat protection profile can neither modify **Events per Second per Rule** and **Disable multiple DNS requests via single TCP session** settings at the member level nor enable or disable rules and change rule parameters at the member level.

3. Click **Next** to add extensible attributes.
4. Save the configuration.

### Cloning Threat Protection Profiles

You can create a new threat protection profile by cloning an existing one. The appliance creates a new profile with the settings that are copied from the source profile. You can also associate extensible attributes with the profile. Note that members in the source profile are not carried over to the cloned profile. You must associate new members with the newly cloned profile.

To clone a threat protection profile:

1. From the **Data Management** tab, select the **Security** tab -> **Profiles** and select the threat protection profile that you want to clone, click the **Action** icon.
Threat Extensible Profiles version Rule Protection Profile Selector Members

By default, all ruleset versions, events per second per rule, and disable multiple DNS requests via single TCP session are inherited from items.

(x): All fields are automatically propagated with available information. You can modify the values in the Management Changes: Indicates whether the rule is a newly added rule or it has been deleted.

Rules. (x): All fields are automatically propagated with available information. You can modify the values in the Management Changes: Indicates whether the rule is a newly added rule or it has been deleted.

Profiles. The name of the rule.

Profile Security Profiles Wizard Member Advanc Profile Profiles version Profile Protection Management Changes: Indicates whether the rule is a newly added rule or it has been deleted.

Ruleset Me Security Attributes Ruleset Protection Protection Upd

The table displays the following information for each changed rule:

- **Rule ID:** The rule ID of the changed rule. You can click the rule link and modify parameters in the rule editor.
- **Rule Name:** The name of the rule.
- **Type:** Indicates whether the rule is a newly added rule or it has been deleted.

To merge a threat protection profile:

1. From the Data Management tab, select the Security tab -> Profiles tab, select the threat protection profile that you want to modify, click the Action icon

and then select Edit.

2. The Threat Protection Profile editor contains the following tabs from which you can modify information:
   - **General:** All fields are automatically propagated with available information. You can modify the values in the Basic and Advanced tabs. For more information, see Adding Threat Protection Profiles.
   - **Member Assignment:** Add or delete members that are associated with the respective threat protection profile. Click the Add icon to associate a member with the selected profile. In the Threat Protection Member Selector dialog box, select the member you want to associate with the profile. For more information, see Listing Members. To delete a member that is associated with the profile, select the check box next to the respective member and click the Delete icon.
   - **Extensible Attributes:** Add and delete extensible attributes that are associated with the template. You can also modify the values of the extensible attributes. For more information, see Using Extensible Attributes.

3. Save the configuration.

You must publish the changes after modifying a threat protection profile. For more information about publishing changes, see Publishing Rule Updates.

**Note:** By default, all ruleset versions, events per second per rule, and disable multiple DNS requests via single TCP session are inherited from the Grid unless you click Override to change the Grid settings.

You can merge the threat protection rulesets from one profile to another before you publish it. The following rules are applicable when you update a ruleset that is assigned to a profile and migrate the profile settings to a new ruleset:

- NIOS migrates the profile settings of the rule to the new ruleset when you override a rule, which exists in both the old and the new ruleset, at the profile level.
- The profile ruleset continues to inherit the settings from the Grid if you do not override a rule that exists in both the old and the new ruleset.
- NIOS removes the profile settings for a rule when you override the rule settings for a profile and the rule does not exist in the new ruleset.
- When a rule exists only in a new ruleset, it inherits the settings from the Grid by default.
- Parameters for custom rules are migrated only when the same custom rule exists in the new ruleset.

You can view differences between the old profile and the new one before you publish the changes. The appliance shows you the system-level changes, including new rules, deleted rules, and rule syntax, between the two rulesets and customizations from the old profile. You can then select the changes you want to merge into the new profile. You can also modify some of these customized changes before you merge them into the new profile. When merging profiles, all rules in the old ruleset and new ruleset are compared and identified by their rule IDs. To merge a threat protection profile:

1. From the Data Management tab, select the Security tab -> select either Threat Protection Rules or Members or Profiles tab, click Merge from the Toolbar, and then select Profile from the drop-down list.
2. In the Merge Changes Into Profile Ruleset editor, complete the following:
   - **Old Profile:** From the drop-down list, select the threat protection profile from which you want to merge changes into the new profile. The Comment field displays additional information about the profile and Ruleset version displays the ruleset version.
   - **New Profile:** From the drop-down list, select the threat protection profile to which you want to merge changes. The Comment field displays additional information about the profile and Ruleset version displays the ruleset version.
   - **Get Differences:** Click this to display a list of differences between the old and new profiles. The appliance displays system-level changes in the System changes from old profile (x items) table, where x is the total number of changed rules between the old and new profiles. The appliance merges all system-level changes listed in this table into the new profile.

The table displays the following information for each changed rule:

- **Rule ID:** The rule ID of the changed rule. You can click the rule link and modify parameters in the rule editor.
- **Rule Name:** The name of the rule.
- **Type:** Indicates whether the rule is a newly added rule or it has been deleted.
• **Old Ruleset Value**: Displays the old ruleset value.
• **New Ruleset Value**: Displays the new ruleset value.

The **Customizations from old profile (x items)** table displays customized rule parameter changes between the old and new profile, where x is the total number of changed rules. You can select all or specific changed rules in this table to be merged into the new profile. You can also modify the parameters for selected rules before merging the changes into the new profile. This table displays the following information for each rule:

• **Member/Profile**: The Grid member on which this rule is currently running.
• **Rule ID**: The rule ID of the changed rule. You can click the rule link and modify parameters in the rule editor.
• **Rule Name**: The name of the rule.
• **Old Ruleset Value**: Displays the old ruleset value.
• **New Ruleset Value**: Displays the new ruleset value.
• **Action**: Displays what the appliance will do to changes in this rule when you merge the profiles.

3. Click **Merge Changes** to copy all the selected rules and changes you made to specific rules to the new profile. Note that you must select a rule from the **Customizations from old profile (x items)** table to activate the merging operation.

You can do the following in the **Merge Changes Into Profile Ruleset** editor:

- Click **Export** to export all the changes listed in both tables to one CSV file. You can export this data after you click **Get Differences** and Grid Manager displays changes in both tables.
- Perform another profile merge by selecting another old profile and new profile.
- Click **Close** to exit the editor. Note that the editor does not close automatically after a merge.

**Inheriting Grid Rule Settings**

When you select this option, NIOS automatically inherits the rule settings of the Grid for the respective profile. For example, if you update a rule at the Grid level, you can select this option to reflect the same changes in the profile. To inherit Grid rule settings for the selected profile, from the **Data Management** tab, select the **Security** tab -> **Profiles** tab, select the threat protection profile, click the Action icon

and then select **Inherit Grid Rule Settings**. Click **Yes** in the confirmation dialog box to inherit the settings.

**Deleting Threat Protection Profiles**

When you select this option, NIOS deletes the selected threat protection profile from the database. When you delete a threat protection profile or a profile rule, the appliance puts them in the Recycle Bin, if enabled. You can restore them if necessary. Note the following about threat protection profiles:

- When you delete a profile that contains an active ruleset, which is overridden at the profile level, you can restore the profile including the configuration if the ruleset exists on the Grid. You cannot restore the profile if the ruleset is deleted.
- When you delete a profile that inherits ruleset from the Grid, and if the same ruleset is still active on the Grid, you can restore the profile including the configuration for profile rules. If the ruleset is deleted or if the active ruleset on the Grid has changed, the appliance restores the profile from the Grid along with the profile rule settings for the current active ruleset.

To delete a threat protection profile, from the **Data Management** tab, select the **Security** tab -> **Profiles** tab, select the threat protection profile that you want to delete, click the Action icon

and then select **Delete**. Click **Yes** in the confirmation dialog box to delete.

**Viewing Threat Protection Profiles**

To view the list of threat protection profiles:

1. From the **Data Management** tab, select the **Security** tab, and then click the **Profiles** tab. Grid Manager displays the following information:
   • **Name**: The name of the threat protection profile. Click the **profile** name to view the rules that are associated with the selected threat protection profile. For more information about rules, see **Viewing Threat Protection Rules**.
   • **Version**: The version of the threat protection profile.
   • **Members**: Displays the member associated with the threat protection profile. You can sort the values in this column.
   • **Comment**: Displays information that you specified for the threat protection profile.
   • **Site**: The location to which the member belongs. This is one of the predefined extensible attributes.

You can also do the following:

- Use **Global Search** to search for threat protection profiles by name, comment or object type. For information, see **Using Global Search**.
- Use **Smart Folders** to organize threat protection profiles by name, comment or object type. For information, see **About Smart Folders**.
- To export the entire list of threat protection profiles in a csv format, click the Export icon and choose **Export Data in Infoblox CSV Import Format**. It also exports the customized rules for the profile. For more information, see **Exporting Data to Files**. To export all data in a
Managing Threat Protection Rules

You can modify any previously defined custom rules, or some of the parameters for system and auto rules. For most system and auto rules, you may change the Action and Log Severity. You can also enable or disable individual rules or an entire category of rules.

If you have selected to manually update threat protection rules, you must download updated rules from the Infoblox Support web site and then publish them to the system.

When a member is associated with a profile, it automatically uses the ruleset that is associated with the profile. When you delete the associated profile, member uses the ruleset that was previously associated with it.

You can do the following after the initial setup, including uploading the initial ruleset:

- Look at rules that are currently installed on your system, as described in Viewing Threat Protection Rules.
- Enable and disable certain rules, as described in Enabling and Disabling Rules.
- Upload rule updates to the system when you have selected to manually apply rule updates, as described in Modifying System and Auto Rules.
- Publish rule updates that you have uploaded to the system, as described in Publishing Rule Updates.
- Modify existing system rules, as described in Modifying System and Auto Rules.
- Modify custom rules, as described in Modifying Custom Rules.

Viewing Threat Protection Rules

You can view the threat protection rules in one of the following views:

- Click Toggle Flat View to display a flat list of all the threat protection rules. In the flat view, each of the custom, system, and auto rules are listed separately.
- Click Toggle Tree View to display only the category of threat protection rules. You can expand the category of rule to view individual rules listed in each category.

To view rules categories and individual rules in a specific ruleset version:

1. **Grid**: From the Data Management tab, select the Security tab -> Threat Protection Rules tab. **Member**: From the Data Management tab, select the Security tab -> Members tab -> member link. **Profile**: From the Data Management tab, select the Security tab -> Profile tab -> profile link.
   
2. In the Grid Security or Member Security table, click the Version link and Grid Manager displays the threat protection rules by categories. The Category column lists all the category to which rules belong.

3. To view individual rules listed in each category, expand the list by clicking the arrow beside the check box. You can view the following information for each rule:
   
   - **Category**: The category to which the rule belongs.
   - **Order**: The number that indicates the order in which the rule will be executed by the appliance. The rule order can change during a ruleset update.
   - **Rule ID**: The ID of the rule.
   - **Rule Name**: The name of the rule. This can contain up to 255 characters.
   - **Type**: The rule type. This can be Custom, System, or Auto. For more information about each rule type, see Understanding Threat Protection Rulesets and Rules.
   - **Disabled**: Displays whether the rule is disabled. A disabled rule does not perform any mitigation functions.
   - **Comment**: Comments that were entered for the rule. This can contain up to 255 characters.
   - **Action**: The operation that the appliance performs when the event occurs. This can be one of the following:
     - **Alert**: The appliance passes the packets and logs the event.
     - **Drop**: The appliance drops the packets and logs the event.
     - **Pass**: The appliance passes the packets but does not log the event.
- **Description**: Description about the rule. This can contain up to 255 characters.
- **Rule Parameters**: Displays the rule parameters that are configured for the rules and the corresponding values for the rule parameters.
- **Log Severity**: Log severity level. This can be **Critical**, **Major**, **Warning**, or **Informational**.

You can also do the following in this panel:

- Click the Action icon

  and select one of the following actions for a rule category:

  - **Enable All Rules in Category**: Select this to enable all the rules in the selected category. For a Grid member, this action overrides the Grid rule settings.
  - **Disable All Rules in Category**: Select this to disable all rules in the selected category. For a Grid member, this action overrides the Grid rule settings.
  - **Inherit Grid Rule Settings in Category**: Select this to inherit Grid rule settings for the selected category. This appears only for member settings.

- Modify some of the data in the rules table. Double click a row, and modify the data. Click **Save** to save the changes. Note that some fields are read-only.

- Select the check box of a rule and click the **Edit** icon to modify the properties of the rule.

- Select the check box of a custom rule and click the **Delete** icon to delete a custom rule.

- Print or export the data.

- Publish changes you make to the rules by clicking **Publish Changes** from the Toolbar. For more information, see **Publishing Rule Updates**.

- Use filters and the **Go to** function to narrow down the list. With the autocomplete feature, you can just enter the first few characters of an object name in the **Go to** field and select the object from the possible matches.

**Note**: When you use the **Go to** function to search for specific rules, Grid Manager may return duplicates of the same rules due to the paging mechanism currently used for displaying information.

- Create a quick filter to save frequently used filter criteria. For more information, see **Using Quick Filters**.

### Using Quick Filters

You can use the following quick filters to filter threat protection rules in the Grid Rules panel. When you select a filter, Grid Manager displays only the specified rules. Using filters makes it easier to locate specific rules for editing, enabling, and disabling.

- **All Auto Generated Rules**: This option shows all auto-generated rules defined in the Infoblox Advanced DNS Protection solution.
- **All Custom Rules**: This option shows all whitelisting and blacklisting custom rules defined by NIOS users.
- **All System Rules**: All protocol-specific rules associated with particular attack phenomena.
- **All Disabled Rules**: This option shows all disabled rules.
- **All Enabled Rules**: This option shows all enabled rules.

For more information about filters, see **Using Filters**.

### Enabling and Disabling Rules

By default, all activated threat protection rules apply across the entire Grid. Enabling or disabling a rule category will enable or disable all rules contained in that category. You can also enable or disable individual rules.

**To enable or disable all rules in a category, do the following:**

1. Grid: From the **Data Management** tab, select the **Security** tab → **Threat Protection Rules** tab, and then click the ruleset link.
   
   Member: From the **Data Management** tab, select the **Security** tab → **Members** tab, and then select a member and click the ruleset link.

2. In the Threat Ruleset table, click the Action icon

   next to the rule category, and choose **Enable All Rules in Category** or **Disable All Rules in Category**. Either option can be disabled depending on the current state of the rules in the category. For members, you can select **Inherit Grid Rule Settings in Category** to inherit rule settings from the Grid.

**To enable or disable individual rules, do the following:**

1. Grid: From the **Data Management** tab, select the **Security** tab → **Threat Protection Rules** tab, and then click the ruleset link.
   
   Member: From the **Data Management** tab, select the **Security** tab → **Members** tab, and then select a member and click the ruleset link.

2. Click the arrow beside a rule category to expand all rules in a rule category.

3. Click the Action icon

   next to a rule and choose **Enable** or **Disable** from the menu. Either option can be disabled depending on the current state of the rule.
Note: Depending on the nature of the rules, you may or may not be able to disable or enable certain rules.

Modifying System and Auto Rules

1. From the Data Management tab, select the Security tab -> Threat Protection Rules tab.
2. In the Grid Rules table, expand the category to which the rule belongs, select the check box, and then click the Edit icon.
3. In the System Rule or Auto Generated Rule editor, select the Description tab -> Basic tab to modify the following:
   - Comment: Enter information about the system rule.
   - Disable: Select this check box to disable the system rule. You cannot disable auto rules. You can also view the following information (but you cannot modify it):
     - Rule ID: Displays the rule ID of the system rule.
     - Name: Displays the name of the rule.
     - Category: Displays the category to which the system rule belongs.
     - Description: Displays the description of the system rule.
   - Order: Displays the number that indicates the order in which the rule will be executed by the appliance. The rule order can change during a ruleset update.
4. In the System Rule or Auto Generated Rule editor, select the Settings tab -> Basic tab. Depending on the rule, you may or may not be able to modify the following:
   - Action: Displays one of the following: Alert, Drop or Pass. Some rules are restricted to specific actions. For example, the action for all blacklisting rules is set as Drop, where the appliance drops the packets and logs the activity when such an event occurs. The action for all whitelisting rules is set as Pass, where the appliance silently passes the packets without logging when such an event occurs.
     - Alert: Logs the activity, and passes the packet.
     - Drop: Logs the activity and drops the packet.
     - Pass: Silently passes the packet without logging.
   - Log Severity: Select the log severity level from the drop-down list. You can select Critical, Major, Warning, or Informational. The selection here corresponds to the severity levels you configure for logging in the syslog.
   - Rule Parameters: In the Rule Parameters table, the Description column displays the rule parameters. Click the row and enter the corresponding values for the rule parameters in the Value column. Depending on the rule, this table displays only the parameters that are relevant to the system or auto rule.
5. Save the configuration.

Modifying Custom Rules

1. From the Data Management tab, select the Security tab -> Threat Protection Rules tab.
2. In the Grid Rules table, expand the category to which the rule belongs, select the check box, and then click the Edit icon.
3. In the Custom Rule editor, select the General tab -> Basic tab to modify the following:
   - Comment: Enter information about the custom rule.
   - Disable: Select this check box to disable the custom rule.
   You can also view the following information (but you cannot modify it):
     - Template: Displays the name of the template the custom rule uses.
     - Rule ID: Displays the rule ID of the custom rule.
     - Name: Displays the name of the rule.
     - Category: Displays the category to which the custom rule belongs.
     - Description: Displays the description of the custom rule.
4. In the Custom Rule editor, select the Settings tab -> Basic tab to modify the following:
   - Log Severity: Select the log severity level from the drop-down list. You can select Critical, Major, Warning, or Informational. Log severity may have an effect on how other Grid services respond to particular events. The selection here corresponds to the severity levels you can configure for logging in the syslog.
   - Rule Parameters: In the Rule Parameters table, the Description column displays the rule parameters. Click the row and enter the corresponding values for the rule parameters in the Value column.
   - Action: Displays the operation which the appliance performs when this event occurs. Some rules are restricted to specific actions. For example, the action for all blacklisting rules is set as Drop where the appliance drops the packets and logs the activity when such an event occurs. The action for all whitelisting rules is set as Pass, where the appliance silently passes the packets without logging when such an event occurs.
5. Save the configuration.

Monitoring Threat Protection Events

You can monitor threat protection events through the following:
- Syslog, as described in Monitoring through Syslog.
Monitoring through Syslog

To receive threat protection events in the syslog, you must enable the Security option in the DNS logging category of the Grid DNS Properties editor. For information about configuring the logging category, see Setting DNS Logging Categories. Once the Security option is enabled, hardware-based appliances log each threat protection related event in the syslog in CEF (Common Event Format). You can get detailed information about the events by reviewing the syslog periodically. For information about how to configure the syslog server, see Using a Syslog Server.

When a DNS attack is detected against an enabled rule, the appliance generates a log message. Note that only threat protection messages in CEF are displayed in the syslog. The log messages for rate limiting alert events also include the FQDNs extracted from DNS queries whose standard query and question count is greater than zero so you can quickly identify the offending clients. Note that the FQDN field displays “NA” for invalid DNS queries. This feature is enabled by default. You can disable this only in Maintenance Mode using the CLI command set smartnic-debug-adp-log-fqdn off.

Example:

When the appliance detects ICMP ping attacks that exceed the pint size against an existing auto rule that has the following configuration:

- Log Severity = Critical
- Rule ID = 120600925
- Rule Name = Potential DDoS related domain
- Rule Action = Drop
- Rule Category = Potential DDoS related Domains

It generates the following threat detection event log message:

```
2016-03-30T12:30:17-07:00 daemon ol-18-114.tme.infoblox.com
threat-protect-log[15396]: err adp: CEF:0|Infoblox|NIOS
Threat|7.3.2-316478|120600925|Potential DDoS related domain:
uuu9.com|7|src=10.10.50.62 spt=60154 dst=25.11.11.114 dpt=53 act="DROP"
cat="Potential DDoS related Domains" nat=0 nfpt=0 nlpt=0 fqdn=lol.uuu9.com
```

The number of log messages generated is based upon your Event per Second per Rule setting. For example, if the setting is 5, the appliance generates five log messages of the same event per second when the attack continues within the time duration. Each log message contains the following information:

- The timestamp when the event happened in yyyy-mm-ddThh:mm:ss+00:00 format.
- **Infoblox|NIOS Threat|x.x.x**: Indicates the Infoblox product, and x.x.x represents the NIOS version.
- The number following the NIOS version is the rule ID. In this example, it is 120600925.
- Following the rule ID is the rule name specified in the rule.
- Following the rule name is the log severity. The following numbers indicate the severity levels:
  - 8 = Critical
  - 7 = Major
  - 6 = Warning
  - 4 = Informational
- **src**: Source IP address.
- **spt**: Source port.
- **dst**: Destination IP address.
- **dpt**: Destination port.
- **act**: The rule action, which can be ALERT, DROP, or PASS, depending on the rule configuration.
- **cat**: The rule category to which the rule belongs. In this example, the rule category is “Potential DDoS related Domains.” For information about rule categories, see System and Auto Rule Categories.

To view DNS threat protection related log messages:

1. From the Administration tab, select the Logs tab -> Syslog tab.
2. From the drop-down list at the upper right corner, select the Grid member on which you want to view the syslog.
3. From the Quick Filter drop-down list, select Threat Rule Update Events or Threat Detection Event Logs to view rule update events or threat detection events respectively. To narrow down the system messages you want to view, click Show Filter and then select the filters you want to use. For information about how to use filters, see Using Filters.

Threat Protection Statistics Widget

You can also get a high-level view of the threat protection events through the Status Dashboard. The Advance Appliances provide the Threat Protection Statistics widget so you can monitor the trend and counts of the various events. For more information about the Dashboard and the Threat Protection Statistics widget, see Status Dashboards.

Threat Protection Reports
NIOS provides a series of reports to monitor and analyze DNS threat protection events. When you integrate a reporting member in your Grid, you can get the threat protection both hardware and Software ADP related reports so you can monitor event counts by severity, member, rule, and rule category. Note that all reporting traffic goes over the MGMT port on the reporting member by default. If for any reasons you need to configure a different interface for the reporting traffic, you can do so through the reporting Member Properties editor. For detailed information about these reports and how to configure the interface for reporting traffic, see Security.

DNS and Network-Flood Threats

DNS is a tempting target for attacks given that it is a core Internet service. Attackers can send malformed DNS queries or DNS responses to the targeted server, hoping to exploit bugs in its DNS implementation. Other variants include code insertion, buffer overflows, memory corruption, NULL pointer dereferencing, and specific vulnerability exploits.

DNS attacks tend to follow specific patterns but can be difficult to deal with using only rate-limiting techniques, because of the sheer scale of many recent attacks. DNS threat protection is designed to grow and expand over time, through threat protection rule updates, to deal with both outside-in and inside-out attacks on network infrastructure and Internet services.

Following are some of the network-flood attacks that can target your DNS caching and authoritative servers:

Internet Control Message Protocol (ICMP) Flood

An ICMP flood attack is also known as a ping attack in which attackers send a large number of ICMP ping packets to a DNS server repeatedly in order to hinder the server’s ability to respond to other requests. It can also be an attempt to send a large number of ping packets to the broadcast IP of a subnetwork, otherwise known as a Smurf attack, as a basic means of amplifying an attack across more hosts than a normal ping would typically permit. These types of attacks can be dealt with by setting a policy to disallow pings to the broadcast IP on the network.

Note: When threat protection is enabled, ICMP ping size (for IPv4 and IPv6) is limited to 16,000 bytes.

SYN Flood

A host sends a long stream of TCP SYN packets, frequently using a forged sender address. Because TCP regards a SYN packet as part of a legitimate connection request, the requested server starts a half-open connection by responding with a SYN ACK packet. Since the sender address is faked, the final ACK response from the sender never comes, and the half-open TCP socket closes only after a time out interval. A massive wave of SYN requests with fake senders can wipe out the connection resources of a network device, effectively locking it away from legitimate users.

UDP DNS Flood

UDP Flood is a denial-of-service attack that uses the connectionless UDP transport protocol and attempts to send large numbers of packets to random UDP protocol ports on a remote system, or to a specific protocol. UDP flood is a reflection attack that is often used for attacking DNS servers operating on UDP port 53. UDP flooding typically uses IP spoofing, in which the sender address is faked. The purpose is to occupy so many resources on the target that it can no longer provide its services on the network.

Inside-Out Attacks

A sophisticated form of "phishing" in which an attacker is able to inject a worm or other piece of attack software onto a host machine, which thereupon captures sensitive information such as logins, and adds that data to DNS queries that can be sent from the trusted machine to an untrusted entity for collection. DDoS Security detects data leaks of this type, logs the incident, and funnels the suspect packets to a quarantine location. In a similar vein, DNS Tunneling uses DNS as a covert channel to avoid firewall and IPS security mechanisms. Tunneling encapsulates Inbound and outbound packets inside DNS requests and DNS responses.

DNS Fluxing

the use of a system called a Domain Generation Algorithm botnet to perform one of the following attacks:

- **Fast Fluxing**: Forcing rapid swapping in and out of IP addresses, with extremely high frequency through changing DNS records with brief TTLs
- **Domain Fluxing**: Forcing constant changing of and allocation of multiple fully-qualified domain names (FQDNs) to a single IP address on the recursive or authoritative DNS server.

DNS Cache Poisoning

With cache poisoning, attackers attempt to insert a spoofed DNS response to a DNS resolver, which then stores the response in its cache, where it lives until the TTL expires. The cache is poisoned and subsequent requests for the domain address to recursive name servers are answered with the address of a different server, presumably controlled by the attacker. So long as the fake entry resides in the DNS server cache (persistence of a cache entry is usually governed by time to live) it can result in hundreds of thousands of dangerous redirects. In such cases the URL is legitimate, but the destination servers are not. This process is often called a "pharming" attack. Web servers and mail servers are frequent targets. Other redirection attacks include DNS Changer and DNS Replay. Man-in-the-middle is another descriptive term for many redirection attacks.
DNS Reflection and Amplification Attacks

As with UDP flood, DNS reflection attacks use a form of IP spoofing, changing the source address in their DNS queries to show the address of their intended target, such as a DNS root server or a top-level domain (TLD) name server operator. DNS reflection and amplification recognizes UDP as an asymmetrical protocol (small requests, large responses) and the existence of open DNS resolvers to the Internet cloud. The result is that small DNS queries reflect large UDP datagram responses to the target address in the original source datagrams. Some recent attacks have used this DDoS technique at a huge scale. Because DNS runs over UDP and does not require a handshake, it is possible to use the protocol as a means to lock down a host or a network. Designed a specific way, sending a small query to any open DNS resolver can result in a single response containing several kilobytes or more, that are sent to the unwitting spoofed victim. (This type of response typically is sent via TCP, as UDP does not allow for more than 512 bytes in a response datagram. The resulting packet usually exceeds the MTU of the recipient’s interfaces, resulting in further packet fragmentation and processing.) Open DNS resolvers may allow for launching DDoS attacks containing hundreds of gigabytes of data. Attackers may also use the EDNS0 DNS protocol extension as a means to enable larger DNS responses. Many network operators, particularly overseas, allow open DNS resolvers to run on their networks, unwittingly allowing attackers to abuse them. Many network operators do provide intelligent rate-limiting to prevent abuse, even while supporting open recursive DNS servers. Hence, issues of this type usually result from mistakes in configuration.

DNS Malware

Sophisticated malware also has emerged as a serious threat to DNS infrastructure. They are classified as Advanced Persistent Threats, and use DNS to embed themselves in the target network and stealthily communicate with external command servers to obtain malware updates, instructions, and to conduct attacks for data theft, industrial espionage and other goals.

DNS Domain Hijacking

Domain hijacking or domain theft is the act of changing the registration of a domain name without the permission of its original registrant. Domain hijacking is generally done by exploiting a vulnerability in the domain name registration system or through social engineering. In some cases however, domain hijackers alter the DNS data of a domain after gaining control of it. They consequently redirect users to a fraudulent site, instead of the legitimate site, on the Internet.

To protect your authoritative DNS server against DNS domain hijacking, you can configure the appliance to monitor NS records and glue records of top-level authoritative zones. Based on your configuration, the appliance periodically checks DNS data in the NS RRsets for these zones and compares the data with that in the appliance database. It then reports any data discrepancies through SNMP traps and logs related events in the syslog. You can also monitor the status of DNS data discrepancies, if any, through the DNS Integrity Check widget on the Task Dashboard. The severity in data discrepancies can help identify possible domain hijacking. For more information about how to configure this feature, see About DNS Integrity Check for Authoritative Zones.

Chapter 43 Infoblox DNS Firewall

This chapter provides information about the Infoblox DNS Firewall feature that you can configure and manage on the Infoblox appliance. It includes the following sections: About Infoblox DNS Firewall

About Infoblox DNS Firewall

Infoblox DNS Firewall employs DNS RPZs (Response Policy Zones), a technology developed by ISC (Internet System Consortium) for allowing reputable sources to dynamically communicate domain name reputation so you can implement policy controls for DNS lookups.

On an Infoblox appliance, you can configure RPZs and define RPZ rules to block DNS resolution for malicious or unauthorized hostnames, or redirect clients to a walled garden by substituting responses. You can assign actions to RPZ rules. For example, abc.com can have an action of pass thru or substitute (domain) with the domain xyz.com. You can also configure a Grid member to act as a lead secondary that receives RPZ updates from external reputation sources and redistributes the updates to other Grid members. Infoblox DNS Firewall supports both IPv4 and IPv6 networks. It also facilitates the detection of malware and APTs (Advanced Persistent Threats) by integrating the NIOS appliance with a FireEye appliance. You can employ APT mitigation strategy using FireEye as an external threat detection source.

An Infoblox Grid performs RPZ actions for queries that originate from external sources. The name server recursive cache on an RPZ enabled Grid member uses the address of the client from which the query originates to identify if the query is generated from an external source or an internal Grid. If the query originates from a Grid Master or a Grid member that has RPZ license installed, RPZ actions are automatically bypassed for those queries. For RPZ, Infoblox uses the ACL infoblox-deny-rpz, which contains a list of addresses for bypassing RPZ actions. The infoblox-deny-rpz list excludes Grid members that do not have an RPZ license. Note that RPZ action is performed only once for a single recursion.

As illustrated in Figure 42.1, the Infoblox DNS server receives RPZ updates, which include blacklisted hostnames and responses, from a reputation data server through a DNS zone transfer. The appliance then blocks or redirects queries and responses based on the imported RPZ rules. The reporting server can then generate the DNS Top RPZ Hits report that details the top DNS clients that have received redirected responses through RPZs.

Figure 42.1 Infoblox DNS Firewall
There are three types of RPZs:

- **Local RPZ** – A local RPZ is a zone that allows administrators to define multiple response policies locally. Responses sent are based on the defined rules. For information about how to configure local RPZs, see [Configuring Local RPZs](#).
- **RPZ Feed** – An RPZ feed receives response policies from external sources. DNS clients receive responses based on the imported rules from a reputable source, such as a commercial RPZ provider. For information about RPZ feed, see [Configuring Infoblox Threat Intelligence Feed](#).
- **FireEye integrated RPZ** – By integrating the NIOS appliance with the FireEye appliance, you can detect malware and APTs and take necessary actions to mitigate those threats. For information about FireEye integrated RPZ, see [About FireEye Integrated RPZs](#).

**Note:** You can configure up to a total of 32 RPZs, including local and FireEye integrated RPZs.

### Setting Up Infoblox DNS Firewall

For a successful Infoblox DNS Firewall deployment to protect your endpoint devices and servers from stealthy malware and malicious hostnames, consider the guidelines described in [Best Practices for Configuring RPZs](#). To configure Infoblox DNS Firewall, complete the following tasks:

1. Install a valid RPZ license on the appliance, as described in [License Requirements and Admin Permissions](#). For more information about RPZ licenses, see [License Requirements and Admin Permissions](#).

**Note:** Ensure that you have installed a valid DNS license on the same appliance.

2. Enable recursive queries for a DNS view, member, or Grid, as described in [Enabling Recursion for RPZs](#).

**Note:** Ensure that you enable recursive queries for RPZ rules to take effect.

3. Configure RPZ logging to ensure that all matching and disabled rules for all queries are logged in the syslog. You can view the syslog to ensure that the rules are set up correctly before they take effect. Ensure that you enable `rpz` in the **Logging Category** of Grid DNS Properties editor to log these events. For information about how to set logging categories, see [Setting DNS Logging Categories](#).

4. You can configure a local RPZ, an RPZ feed, or a FireEye RPZ on the NIOS appliance. Complete one of the following depending on your selection:

   - **On a DNS member, complete the following to create local RPZ rules:**
     - a. Create an RPZ, as described in [Configuring Local RPZs](#).
     - b. Configure rules for the local RPZ you have created, as described in [Configuring Rules for RPZs](#).

   - **Optionally, complete the following to receive RPZ updates from an RPZ feed:**
     - a. Configure an RPZ feed, as described in [Configuring Local RPZs](#). You can also configure the Infoblox DNS feed, as described in [Configuring Infoblox Threat Intelligence Feed](#). The Infoblox DNS feed is a reputable data server validated by Infoblox to provide reputation RPZ updates.
b. Download rules from the RPZ feed, as described in Downloading Rules for an RPZ Feed.

- Optionally, complete the following to receive alerts from a FireEye appliance:
  a. Create a FireEye integrated RPZ, as described in Configuring FireEye RPZs.
  b. Define rules for FireEye RPZs, as described in Configuring Rules for FireEye RPZs.
  c. Create FireEye admin users, as described in Configuring the FireEye appliance.
  d. Add URLs and user credentials on the FireEye appliance, as described in Configuring FireEye RPZs.

Note: To apply the configured RPZ policies regardless of whether a DNS query requests DNSSEC data, configure the appliance accordingly. For more information about how to configure this, see Applying Policies and Rules to DNS Queries that Request DNSSEC Data.

5. Test your RPZ configuration and verify that RPZ is functioning properly by viewing the syslog and the Last Updated column in the Response Policy Zones tab. For more information, see Testing RPZ Feed Rules.

After you have set up your RPZs, RPZ feeds, and RPZ rules, you can do the following:

- Manage local RPZs such as viewing a list of RPZs, modifying, reordering, and deleting RPZs. You can also lock or unlock RPZs. For more information, see Managing RPZs.
- Verify RPZs are functioning properly by viewing the syslog and the last updated RPZ. For more information, see Managing RPZ Rules.
- Manage Local RPZ rules such as viewing, modifying, and deleting RPZ rules. You can also copy and import RPZ rules. For more information, see Managing RPZ Rules.
- Generate the DNS Top RPZ Hits report, if you have a reporting server set up in the Grid. For more information, see DNS Top RPZ Hits.
- Define thresholds for RPZ hit rate and configure the appliance send alerts when the RPZ hit rate exceeds the thresholds. For information, see Configuring Thresholds for RPZ Hit Rate.

License Requirements and Admin Permissions for RPZ

You must install required licenses before you can use the RPZ feature. An RPZ license is required to configure local RPZs and RPZ feeds. For more information, see For Local RPZs and RPZ Feeds. For FireEye integrated RPZs, you must first install an RPZ license, and then a FireEye license. For more information, see For FireEye Integrated RPZs. For all RPZ related licenses, you can install either a temporary or a permanent license on the NIOS appliance. The temporary license provides a 90-day free trial, which can be upgraded to a permanent license. After the license expires, the RPZs will remain intact, but you cannot delete existing or add new entries to it. Infoblox provides RPZ licenses that are compatible with each product model.

For Local RPZs and RPZ Feeds

Before you install an RPZ license, ensure that the following are completed:

- The entire Grid is running NIOS 6.6 or later.
- Grid members are properly configured and DNS is enabled on the members.

Note: Install RPZ licenses only on Infoblox members that have DNS recursion enabled.

Superusers can configure RPZs and RPZ rules by default. You can also assign global permissions for all RPZs and RPZ rules to specific admin groups and roles. For more information, see Administrative Permissions for Zones.

Grid-wide licenses for RPZ

Infoblox offers a Grid-wide ActiveTrust Plus and ActiveTrust Advanced additional services for DNS Firewall feature. These are subscription licenses that you may have to purchase from Infoblox. When you purchase these services, you can use the ActiveTrust threat subscription data on any appliance that can run DNS Firewall across the Infoblox Grid which you have configured. You can buy these additional services if you do want to use Infoblox threat data and instead use your own or an external threat feed. With these additional services, you get to use a separate license key for each Grid that you use.

When you configure Grid-wide RPZ license for each Grid, RPZ rules are not applied for queries that originate from the other RPZ member(s) of the Grid. When you use multiple Infoblox Grids, you can use the same TSIG key to configure feed zones across all Grids to synchronize feed subscriptions. Note that these services are valid for NIOS versions 8.0 and above. For more information, see Managing Grid-wide Licenses. For a thorough understanding of the RPZ process using various NIOS versions, consider a scenario where you have configured four members on the Grid: GM(RPZ license), M1(RPZ license), M2(DNS license), M3(RPZ license), and RM1 (Reporting Member).

- In NIOS version 7.3, all members with RPZ licenses are added to the ACL list:
  ```
  infoblox-deny-rpz { localhost; GM_IP, Member1_IP; Member3_IP; }
  ```
- In NIOS version 8.x:
  ```
  infoblox-deny-rpz { localhost; GM_IP, Member1_IP; Member3_IP; }
  ```

  - When you install a Grid Wide RPZ license, all members with DNS licenses are added to the ACL list:
infoblox-deny-rpz { localhost; GM_IP, Member1_IP; Member2_IP; Member3_IP; }

- When you install a Grid Wide RPZ license, but not a member level RPZ license, NIOS adds all the members with DNS licenses to the ACL list:

infoblox-deny-rpz { localhost; GM_IP, Member1_IP; Member2_IP; Member3_IP; }

- When you do not install a Grid-wide RPZ license but install member-level RPZ licenses, NIOS adds all members that have RPZ licenses to the ACL list and enables the **Apply RPZ rules only on this member if possible** check box for that member. You can clear the check box.

infoblox-deny-rpz { localhost; GM_IP, Member1_IP; Member2_IP; Member3_IP; }

**Note:** Infoblox suggests that when you upgrade to NIOS 8.0 and later versions, select the check box **Apply RPZ rules only on this member if possible** only if there is an existing RPZ license for the Grid member to ensure that there is no change in behavior due to an upgrade.

Note the following about Grid-wide licenses for RPZ:

- NIOS displays `rpz` in the Grid-wide and Member tabs when RPZ license is installed.
- When you enable a temporary license for RPZ, it is enabled at the Grid level and listed under the **Grid Wide** tab. You do not have to set the license at the member level.
- NIOS performs a pre-provision check for an RPZ member who joins the Grid to verify if a Grid-wide license is installed for the RPZ member. If the Grid-wide license is found, NIOS allows the member to join the Grid.
- If an RPZ license expires, Feed Zone stops receiving feed updates after the grace period. However, the RPZ feature remains active until it expires. This grace period TTL is configured in Active Trust Plus/Advanced services.
- After you remove the Grid-wide license for RPZ, this feature still keeps functioning for members that do not have a Grid-wide license until you restart the service. When you remove the RPZ license that is associated with a specific member, NIOS restarts the service automatically and disables RPZ for the respective member.
- NIOS checks for a Grid-wide license of a pre-provisioned type when a member first joins the Grid. For example, if a member is pre-provisioned for RPZ and a Grid-wide RPZ license is installed, then NIOS allows the member to join the Grid, even though the member does not have a valid RPZ license.

**Customizing Threat Feeds on an RPZ Member**

To configure an RPZ member to use your own or external threat feeds instead of RPZ feeds, complete the following:

1. From the **Data Management** tab, select **DNS**, and then click **Members**.
2. Select a member and click **Edit** from the Toolbar.
3. In the **Member DNS Properties editor**, click **General** tab -> **Advanced** tab.
   - **Apply RPZ rules only on this member if possible**: Select this check box if the forwarders must not apply RPZ rules to the responses that is returned to the other member, when this RPZ member queries other Grid member details.
4. Save the configuration.

**For FireEye Integrated RPZs**

You can enable FireEye integrated RPZs on the appliances that have both the RPZ and FireEye licenses installed. Note that you must install an RPZ license prior to installing the FireEye license.

NIOS appliance creates a new group, `fireeye-group`, when you add the first FireEye zone. The FireEye admin group is read-only and you cannot assign permissions to it. It will not have any superuser privileges and you cannot modify or delete this group. You can add users to the `fireeye-group` admin group, and FireEye users can only send alerts to the NIOS appliance. They cannot access the Infoblox GUI, CLI, API, or RESTful API. These users are authenticated based on the usernames and passwords you configure in the FireEye admin group. Only admin users who belong to the FireEye admin group can publish FireEye alerts. Other admin users cannot do so. For information about how to configure the FireEye appliance, see **Configuring the FireEye appliance**.

**Note:** The `fireeye-group` is created automatically. Infoblox recommends that you do not add a group with the same name. In addition, The “force password change at next login” feature does not apply to admin users in the `fireeye-group`. These users will not be prompted to change their passwords at the next login. Their original passwords continue to work. For more information, see **Managing Passwords**.

To add users to the `fireeye-group`, complete the following:

1. From the **Administration** tab, select **Administrators**, and then click **Admins**.
2. Click **Add** and enter the usernames and passwords. For more information on how to add users to an admin group, see **Creating Local Admins**. Select `fireeye-group` for the admin group and add users to this group.

**Note:** Ensure that you save the usernames and passwords. You must use these credentials when configuring FireEye alerts to enable the alerts to be received by NIOS.
Uninstalling the FireEye License

When you uninstall the FireEye license, new FireEye alerts will not be processed. However, the FireEye integrated RPZs and the rules in those zones will not be deleted. Note the following when you uninstall the FireEye license:

- New FireEye alerts will not be processed
- FireEye RPZ zones that were created before uninstalling the license will remain
- You cannot create new FireEye RPZ zones
- RPZ rules created from the alert will remain
- Note that if the RPZ and FireEye licenses are installed, then you must first remove the FireEye license to remove the RPZ license.
- The fireeye-group and the FireEye zones will remain even after you delete the FireEye license.

Best Practices for Configuring RPZs

Before configuring RPZs, observe the following best practices to ensure a successful configuration:

General RPZ Best Practices

- When you enable Infoblox DNS Firewall, DNS performance for all queries, recursive or authoritative, will be affected.
- For performance reasons, Infoblox recommends that you maintain a reasonable number of zones.
- Do not enable RPZ on multiple layers, such as on DNS client facing servers and forwarding.
- If you have multiple DNS servers in a Grid, ensure that you configure RPZs on the recursive server that is closest to your DNS clients. If you configure RPZs on second level DNS caching servers, you will not be able to identify the DNS clients because only the IP addresses of the forwarding name servers can be identified.
- Infoblox recommends that you preview your RPZ rules to ensure ruleset integrity and to avoid unexpected results. You can preview your rules by selecting **Log Only (Disabled)** when you configure **Policy Override** for an RPZ, RPZ feed, or FireEye integrated RPZ. For information about how to configure this, see [Configuring Local RPZs](#) and **About FireEye Integrated RPZs**.
- The appliance logs all matching and disabled rules for all queries in the syslog. You can view the syslog to ensure that the rules are set up correctly before they take effect. Ensure that you enable rpz in the **Logging Category** of Grid DNS Properties editor to log these events. For information about how to set logging categories, see [Setting DNS Logging Categories](#).
- You can use the standard TSIG mechanism to ensure that feed zones come from the correct servers. Grid members can function either as a primary or secondary servers for the RPZ. As with hosting any zone as a secondary, please ensure that the appliance is sized properly to hold the zone contents in memory.
- You can only export or import the RPZ local zones using the CSV export or import feature, but you cannot import or export FireEye zones using this feature.
- Note that the NIOS blacklist and NXDOMAIN features take precedence over RPZs.
- In order to leverage DNS notify messages to trigger zone transfer of the feed zone, port 53 of the lead secondary must be open to receive such messages. If not, the zone will refresh based on the refresh setting in the SOA.
- The name of the zone, which is assigned to an RPZ member, must not exceed 241 characters. When the name exceeds this limit, respective zone fails to load.

Best Practices For FireEye Integrated RPZs

Before you configure a FireEye integrated RPZ, consider the following:

- FireEye integrated RPZs inherit default values from local RPZs. You can create, edit and delete rules using the Infoblox GUI, API, and RESTful API.
- To avoid false positives, Infoblox recommends that you create a whitelist of allowed zones using a local RPZ that is sorted above the FireEye RPZ and add your own domain to the whitelist RPZ. For example, you can add your company domain name, such as corpxyz.com. This list must contain popular domains, such as Alexa 250, and other desired domains.
- Note that there will be an impact on the storage capacity when you create a new FireEye alert and map it with an RPZ rule. The processing of alerts will consume a few CPU cycles, which will have some impact on the system.
- You must properly configure the settings on a FireEye appliance. NIOS supports only **Per Event** delivery mechanism and JSON **Normal** message format. To ensure that the NIOS appliance process alerts properly, configure the FireEye appliance accordingly. For more information about alerts, see [Handling Alerts from the FireEye appliance](#).
- You cannot add a FireEye integrated RPZ during a scheduled full upgrade. However, updates to the CNAME record are processed during a full upgrade. NIOS updates CNAME records in the database to store information that is specific to FireEye alerts.
- The rules created due to insertion of alerts will be visible through the FireEye RPZ viewer. Infoblox recommends that you do not modify any internal objects. For more information, see [Viewing RPZs](#).
- Note that SSL certificate validation is not supported.
- You must verify the following after you configure the FireEye and NIOS appliances:
  - The URL configured on the FireEye appliance matches the URL in the FireEye integrated RPZ on NIOS.
  - Verify the username and password for FireEye admin on the FireEye appliance.
  - Ensure that the settings are properly configured on the FireEye appliance.
  - Verify the state of the FireEye appliance.
For more information about configuring the FireEye appliance to send alerts to the NIOS appliance, see Configuring the FireEye appliance.

- Note that the frequency of alerts received from FireEye can be minimal. A very small number of alerts are generated on a weekly basis. For example, the FireEye appliance may generate only tens of alerts per day.

**Enabling Recursion for RPZs**

For RPZ rules to function properly, you must enable DNS recursion. You can enable DNS recursion at the Grid, member, or DNS view level. To enable recursion:

- For the Grid or member, see Enabling Recursive Queries.
- For a DNS view, see Managing Recursive DNS Views.

**Configuring RPZs for All Recursive Servers**

When you configure a local or FireEye integrated RPZ, you must define an internal primary name server. The primary name server can be either recursive or non-recursive, depending on its usage. When you configure an RPZ feed, you must define an external primary name server. You can associate a name server or a name server group with the local RPZ, RPZ feed, or FireEye RPZ. You can also configure RPZs and RPZ feeds for all recursive servers in the Grid.

A local RPZ can have one or more secondary name servers associated with it. For an RPZ feed, you must create an external primary name server.

To configure a local RPZ, or RPZ feed, or FireEye RPZ for all recursive servers, complete the following:

1. From the Data Management tab, select the DNS tab -> Response Policy Zones tab, and then click the Add icon.
2. Enter the Response Policy Zone details and click Next to associate an RPZ with at least one name server. For information about creating a local RPZ, see Configuring Local RPZs. For information about creating an RPZ feed, see Configuring Local RPZs. For information about creating a FireEye integrated RPZ, see Configuring FireEye RPZs.
3. Select All Recursive Name Servers from the list to add all the recursive name servers in the Grid as the secondary name servers for the corresponding zone.
   - Save the configuration and click Next to define extensible attributes. Click Restart if it appears at the top of the screen. For information about extensible attributes, see About Extensible Attributes.

**Enabling and Disabling RPZ Query Name Recursion**

In previous NIOS releases, RPZ query name recursion was enabled by default. The DNS recursive name server performed RPZ recursive lookups for the fully qualified domain name that was part of an RPZ. Starting with NIOS 7.1.0, RPZ query name recursion is disabled by default.

When RPZ query name recursion is disabled, the DNS recursive name server sends responses for the domains being queried, without forwarding queries to the authoritative name servers. This can speed up recursive RPZ lookups by eliminating unnecessary recursions for domains that are known to be malicious, possibly caused by internal DDoS attacks on the recursive server.

You can enable RPZ query name recursion by selecting the Enable RPZ query name recursion (qname-wait-recurse) check box. When you select this check box, the appliance performs RPZ query name recursions. You can configure this at the Grid, member, and DNS view levels.

**Note:** RPZ query name recursion is disabled by default. The Enable RPZ query name recursion (qname-wait-recurse) check box is deselected for all new installations and upgrades. You can select this check box to enable RPZ query name recursion.

To enable or disable RPZ query name recursion:

1. From the Data Management tab, select the DNS tab, and then click Grid DNS Properties from the Toolbar.
   - or
   - From the Data Management tab, select the DNS tab -> Members tab -> Grid member check box, and then click the Edit icon.
   - or
   - From the Data Management tab, select the DNS tab -> Zones tab -> dns_view check box, and then click the Edit icon.
2. In the Grid DNS Properties, Member DNS Properties, or DNS View editor, click the General tab -> Advanced tab and complete the following.
   - Enable RPZ query name recursion (qname-wait-recurse): This check box is deselected by default, meaning RPZ query name recursion is disabled. When RPZ query name recursion is disabled, the DNS recursive name server sends responses for the domains being queried, without forwarding queries to the authoritative name servers. When you select this check box, the DNS recursive name server performs recursive lookups for the fully qualified domain names that are part of an RPZ. To override the value inherited from the Grid, click Override. To retain the same value as the Grid, click Inherit.
3. Save the configuration and click Restart if it appears at the top of the screen.

Following are sample configuration details in the named.conf file when the Enable RPZ query name recursion (qname-wait-recurse) check box is deselected:

```plaintext
response-policy {
```
1. zone "local.com" policy Given;# priority 0
2. zone "rpz.net" policy Given;# priority 1
3. zone "example.com" policy Given;# priority 2
   } qname-wait-recurse no;
   dnssec-enable yes;
   dnssec-validation yes;
   dnssec-accept-expired no;
   filter-aaaa-on-v4 no;
   zone "." in {
      type hint;
      file "named.cache._default";
   };

Configuring Local RPZs

You can define local RPZs to match responses for recursive queries. Each RPZ can have various rules associated with it. The response of a recursive query is modified if it matches any of the RPZ rules. The responses are first matched with the RPZ rules, and if there is a match, the rule defined at the RPZ level override is used. When creating a new RPZ zone, you can associate this zone with a threat severity level. The RPZ syslog messages provide information about threat severity level of an RPZ zone associated with the matched RPZ rule. To view threat details, you can drill down to the syslog messages. For more information, Viewing RPZ in the Syslog. You can create multiple local RPZs and define multiple rules for a local RPZ. Note that override depends on the order of the zones. The zones on top will override the zones below. You can change the order of the RPZs. For more information, see Reordering RPZs. You can also configure FireEye integrated RPZs on the NIOS appliance to detect persistent threats and malwares. The NIOS appliance considers the FireEye integrated RPZ as a local RPZ. For more information, see About FireEye Integrated RPZs.

Note: When using IDN (Internationalized Domain Name) in a local RPZ or RPZ feed, you must manually convert the IDN to punycode. For information about IDN, see Support for Internationalized Domain Names.

To configure local RPZs:

1. From the Data Management tab, select the DNS tab -> Response Policy Zones tab, and then click the Add icon.
2. When you click the Add icon, either the Add Response Policy Zone Wizard or the Add DNS View wizard is displayed based on the following:
   - When you click the Add icon, the Add Response Policy Zone Wizard is displayed if you have not created additional DNS views and only have the default view.

3. If you have configured multiple DNS views, you must drill-down to the corresponding view to assign a local RPZ. Click the Add icon and the Add Response Policy Zone Wizard is displayed. To create a new DNS view for your local RPZ, click the Add icon and complete the details in the Add DNS View wizard. For information, see Adding a DNS View. For information on modifying an existing view, see Modifying DNS Views.
   - In the Add Response Policy Zone Wizard, select Add Local Response Policy Zone, click Next and specify the following:
     - Name: Enter the name of the local RPZ. It can be a combination of alphanumeric characters. You can enter up to 256 characters.
     - DNS View: The name of the view that you have selected is displayed by default. You can select a view from the drop-down list to associate it with the local RPZ.

Note: The local RPZ must have a primary Grid name server before you can configure it.

- Policy Override: Select a value from the drop-down list. You can override the policy actions that are specified in the rule level.
  - Log Only (Disabled) – Select this if you want to disable an RPZ rewrite using rules in the RPZ. If the response to the recursive query matches any RPZ rule, then the rule is logged, but the response will not be altered. Note that this option will not override RPZ rules in other RPZ zones, if they take precedence. Select this option to preview the rules in the syslog before they take effect.

Note: When you select this option, the RPZ related reports are not updated, even though there is logging in the syslog.

- None (Given) – Select this if you want to use the policy from the rule level.
- Block (No Data) – Select this to send a response that contains no data in it.
- Block (No Such Domain) – Select this if you want the user to receive a DNS response that indicates there is no domain. All the policy actions in an RPZ are replaced with a NXDOMAIN block.
- Pass thru – Select this if you want to send an actual response without modification. All the policy actions in an RPZ are replaced with the passthru action.
- **Substitute (Domain Name)** – Select this if you want to replace all the policy actions in an RPZ with the specified substitution action.
  - **Domain Name**: This appears only when you select **Substitute (Domain Name)** from the Policy Override list. Enter the domain name that you want the client to receive instead of the actual domain name, which is malicious or unauthorized.
- **Severity**: Select the threat severity level for the RPZ zone. The threat severity you select here determines the severity for the RPZ zone. Select Critical, Major, Warning, or Informational. The default threat severity level is Major. Note that each of these levels is represented by a number in the syslog (8 being Critical and 4 being Informational). When you upgrade to NIOS 7.0.0, the appliance automatically updates the threat severity level to Informational (displayed as 4 in the syslog) for existing RPZ zones. For information about RPZ syslog messages and severity levels, see [Viewing RPZ in the Syslog](#).
- **Comment**: Optionally, enter additional information about the local RPZ.
- **Disable**: Select the check box to disable a local RPZ without deleting its configuration. Clear the check box to enable the local RPZ. For information, see [Enabling and Disabling Zones](#).
- **Lock**: Select the check box to lock the zone so that you can make changes to it and prevent others from making conflicting changes. For information, see [Locking and Unlocking RPZs](#).

4. Click **Next** to associate the local RPZ with at least one primary name server:

   - Define the name servers for the local RPZ. A Grid name server must be recursive when primary Grid name server is used as an RPZ source. A local RPZ may or may not have a recursive server. For example, there could be a Grid that has only primary Grid name server for a local RPZ to act as an RPZ source for an external set of name servers. A local RPZ must have only one primary Grid name server and it can have one or more secondary Grid name servers. When you select **All Recursive Name Servers** from the list, all the recursive name servers in the Grid are added as secondary servers for the zone. For information on specifying primary or secondary name server groups, see [Assigning Zone Authority to Name Servers](#). For information on specifying name server groups, see [About Name Server Groups](#). For information about all recursive name servers, see [Configuring RPZs](#) or [All Recursive Servers](#).

5. Save the configuration and click **Next** to define extensible attributes. Click **Restart** if it appears at the top of the screen. For information, see [About Extensible Attributes](#).

**Note**: You cannot convert a local RPZ to an RPZ feed or vice versa.

### Configuring Rules for RPZs

You can define different RPZ rules to block DNS resolution for malicious or unauthorized hostnames or redirect clients to a walled garden by substituting responses. Depending on the nature of the rule and its usage, each rule is designed to match a hostname, domain name, or IP address, specification or pattern, and an associated action.

These rules are applicable to local RPZs, including FireEye integrated RPZs, except for the RPZ client IP address or network rules which are not applicable for FireEye integrated RPZs. For RPZ feeds, rules are imported from external servers. You cannot change the content of an RPZ feed, but you can override the actions in an RPZ feed.

The RPZ rules are triggered based on the order of the RPZ zones that you have configured. When you configure one or more RPZ rules with the same FQDNs or IP addresses in different RPZ zones, then the RPZ rules in the top-level RPZ zone are triggered first.

**Note**: If an Infoblox-4030 appliance is already associated with a local RPZ as a Grid primary or a Grid secondary name server, then you cannot configure the client IP address or network rules for that local RPZ, and vice versa. But you can associate an Infoblox-4030 appliance with an RPZ feed, even if the RPZ feed contains client IP address or network rules.

To configure RPZ rules:

1. From the **Data Management** tab, select the **DNS** tab -> **Response Policy Zones** tab, click **DNS View** -> **Zone** and then click **Add** -> select a **Rule**.
2. The rules are classified as follows:
   - **Passthru Rule**: For information, see [Managing Passthru Rules](#).
   - **Block (No Such Domain)** Rule: For information, see [Managing Block (No Such Domain) Rules](#).
   - **Block (No Data)** Rule: For information, see [Managing Block (No Data) Rules](#).
   - **Substitute (Domain Name)** Rule: For information, see [Managing Substitute (Domain Name) Rules](#).
   - **Substitute (Record)** Rule: For information, see [Managing Substitute (Record) Rules](#).
3. Complete the details in the corresponding editor.
4. Save the configuration and click **Next** to define extensible attributes. For information about extensible attributes, see [About Extensible Attributes](#).

You cannot define the above rules for an RPZ feed. An RPZ feed uses rules defined by external servers. When you click on an RPZ feed, the appliance displays a dialog box that provides various options to export the rules of the configured external servers in .CSV format.

### Managing Passthru Rules

You can define passthru rules if you do not want to modify the actual responses of the recursive queries. The response received for a query is not modified, if there is a matching passthru rule and the actual response is forwarded to the user.
Adding Passthru Rules for Domain Names

To define passthru rules for domains:

1. From the Data Management tab, select the DNS tab -> Response Policy Zones tab, select DNS_View -> Zone, and then click Add -> select Passthru Rule -> Passthru Domain Name Rule.
   or
   From the Data Management tab, select the DNS tab -> Response Policy Zones tab, and then select a zone. Expand the Toolbar, click Add -> select Passthru Rule -> Passthru Domain Name Rule.
2. The following fields are displayed in the Add a Passthru Domain Name Rule wizard:
   - Name: Enter the domain name for which you want to define the passthru rule. Click Select Zone to select a different zone.
   - DNS View: Displays the DNS view to which the selected RPZ belongs.
   - Policy: Displays the selected policy.
   - Comment: Optionally, enter additional information.
   - Disable: Clear the check box to enable the passthru rule. Select the check box to disable it.
3. Click Next to define extensible attributes. For information, see About Extensible Attributes.
4. Save the configuration.

Adding Passthru Rules for IP Addresses or Networks

To define passthru rules for IP addresses or networks:

1. From the Data Management tab, select the DNS tab -> Response Policy Zones tab, select DNS_View -> Zone, and then click Add -> select Passthru Rule -> Passthru IP Address Rule.
   or
   From the Data Management tab, select the DNS tab -> Response Policy Zones tab, and then select a zone. Expand the Toolbar, click Add -> select Passthru Rule -> Passthru IP Address Rule.
2. The following fields are displayed in the Add a Passthru IP Address Rule wizard:
   - IP Address or Network: Enter the IP address or specify the address in CIDR format for which you want to define the passthru rule. Click Select Zone to select a different zone.
   - DNS View: Displays the DNS view to which the selected RPZ belongs.
   - Policy: Displays the selected policy.
   - Comment: Optionally, enter additional information.
   - Disable: Clear the check box to enable the passthru rule. Select the check box to disable it.
3. Click Next to define extensible attributes. For information, see About Extensible Attributes.
4. Save the configuration.

Adding Passthru Rules for Client IP Addresses or Networks

You can define a passthru rule for a client IP address or network, if you do not want to modify the response to a query from a specific client IP address or network and forward the actual response to the client.

To define passthru rules for the client IP addresses or networks:

1. From the Data Management tab, select the DNS tab -> Response Policy Zones tab, select DNS_View -> Zone, and then click Add -> select Passthru Rule -> Passthru Client IP Address Rule.
   or
   From the Data Management tab, select the DNS tab -> Response Policy Zones tab, and then select a zone. Expand the Toolbar, click Add -> select Passthru Rule -> Passthru Client IP Address Rule.
2. The following fields are displayed in the Add a Passthru Client IP Address Rule wizard:
   - Client IP Address or Network: Enter the client IP address or specify the client address in CIDR format for which you want to define the passthru rule. Click Select Zone to select a different zone.
   - DNS View: Displays the DNS view to which the selected RPZ belongs.
   - Policy: Displays the selected policy.
   - Comment: Optionally, enter additional information.
   - Disable: Clear the check box to enable the passthru rule. Select the check box to disable it.
3. Click Next to define extensible attributes. For information, see About Extensible Attributes.
4. Save the configuration.

Managing Block (No Such Domain) Rules

You can define rules to block certain domain names, IP addresses or networks, or client IP addresses or networks. When you choose this option to block a domain name, the query name is matched with the RPZ rule. If the query name matches the RPZ rule, the DNS client receives a DNS response that indicates the domain does not exist.

When you block an IP address or network using this option, the A and AAAA records are matched with the RPZ rule. If the records match an RPZ rule, the DNS client receives a DNS response that indicates the domain does not exist.
When you choose this option to block a specific client IP address or network, the IP address or network of a client querying the DNS server is matched with the RPZ rule. If the IP address or the network of the client matches the RPZ rule, the DNS client receives a DNS response that indicates the domain does not exist.

**Defining Block (No Such Domain) Rules for Domain Names**

To define block rules for domains:

1. From the Data Management tab, select the DNS tab -> Response Policy Zones tab, select DNS View -> Zone, and then click Add -> select Block (No Such Domain) Rule -> Block Domain Name (No Such Domain) Rule.
   
   or
   
   From the Data Management tab, select the DNS tab -> Response Policy Zones tab, and then select a zone. Expand the Toolbar, click Add -> select Block (No Such Domain) Rule -> Block Domain Name (No Such Domain) Rule.

2. The following fields are displayed in the Add a Block Domain Name (No Such Domain) Rule wizard:
   - **Name**: Enter the domain name which you want to be blocked from being resolved by the DNS. Click Select Zone to select a different zone.
   - **DNS View**: Displays the DNS view to which the selected RPZ belongs.
   - **Policy**: Displays the selected policy.
   - **Comment**: Optionally, enter additional information.
   - **Disable**: Clear the check box to enable the record. Select the check box to disable it.

3. Click Next to define extensible attributes. For information, see About Extensible Attributes.

4. Save the configuration.

**Defining Block (No Such Domain) Rules for IP Addresses or Networks**

To define block rules for IP addresses or networks:

1. From the Data Management tab, select the DNS tab -> Response Policy Zones tab, select DNS View -> Zone, and then click Add -> select Block (No Such Domain) Rule -> Block IP Address (No Such Domain) Rule.
   
   or
   
   From the Data Management tab, select the DNS tab -> Response Policy Zones tab, and then select a zone. Expand the Toolbar, click Add -> select Block (No Such Domain) Rule -> Block IP Address (No Such Domain) Rule.

2. The following fields are displayed in the Add a Block IP Address (No Such Domain) Rule wizard:
   - **IP Address or Network**: Enter the IP address or specify the address in CIDR format which you want to block. Click Select Zone to select a different zone.
   - **DNS View**: Displays the DNS view to which the selected RPZ belongs.
   - **Policy**: Displays the selected policy.
   - **Comment**: Optionally, enter additional information.
   - **Disable**: Clear the check box to enable the block rule. Select the check box to disable it.

3. Click Next to define extensible attributes. For information, see About Extensible Attributes.

4. Save the configuration.

**Defining Block (No Such Domain) Rules for Client IP Addresses or Networks**

To define block rules for client IP addresses or networks:

1. From the Data Management tab, select the DNS tab -> Response Policy Zones tab, select DNS View -> Zone, and then click Add -> select Block (No Such Domain) Rule -> Block Client IP Address (No Such Domain) Rule.
   
   or
   
   From the Data Management tab, select the DNS tab -> Response Policy Zones tab, and then select a zone. Expand the Toolbar, click Add -> select Block (No Such Domain) Rule -> Block Client IP Address (No Such Domain) Rule.

2. The following fields are displayed in the Add a Block Client IP Address (No Such Domain) Rule wizard:
   - **Client IP Address or Network**: Enter the client IP address or specify the client address in CIDR format which you want to block.
     - **DNS View**: Displays the DNS view to which the selected RPZ belongs.
     - **Policy**: Displays the selected policy.
     - **Comment**: Optionally, enter additional information.
     - **Disable**: Clear the check box to enable the block rule. Select the check box to disable it.

3. Click Next to define extensible attributes. For information, see About Extensible Attributes.

4. Save the configuration.

**Managing Block (No Data) Rules**

You can define rules to block certain domain names, IP addresses or networks, or client IP addresses or networks. When you choose this option to block a domain name, the query name is matched with the RPZ rule. If the query name matches the RPZ rule, the DNS client receives a DNS response that indicates there is no data for the requested record type.
When you block an IP address or network using this option, the A and AAAA records are matched with the RPZ rules. If the records match an RPZ rule, the DNS client receives a DNS response that indicates there is no data for the requested record type.
When you choose this option to block a specific client IP address or network, the IP address or network of a client querying the DNS server is matched with the RPZ rule. If the IP address or the network of the client matches the RPZ rule, the DNS client receives a DNS response that indicates there is no data for the requested record type.

Defining Block (No Data) Rules for Domain Names

To define block rules for domains:

1. From the Data Management tab, select the DNS tab -> Response Policy Zones tab, select DNS View -> Zone, and then click Add -> select Block (No Data) Rule -> Block Domain Name (No Data) Rule.
   or
   From the Data Management tab, select the DNS tab -> Response Policy Zones tab, and then select a zone. Expand the Toolbar, click Add -> select Block (No Data) Rule -> Block Domain Name (No Data) Rule.
2. The following fields are displayed in the Add a Block Domain Name (No Data) Rule wizard:
   - **Name**: Enter the domain name which you want to block. Click Select Zone to select a different zone.
   - **DNS View**: Displays the DNS view to which the selected RPZ belongs.
   - **Policy**: Displays the selected policy.
   - **Comment**: Optionally, enter additional information.
   - **Disable**: Clear the check box to enable the block rule. Select the check box to disable it.
3. Click Next to define extensible attributes. For information, see About Extensible Attributes.
4. Save the configuration.

Defining Block (No Data) Rules for IP Addresses or Networks

To define block rules for IP addresses or networks:

1. From the Data Management tab, select the DNS tab -> Response Policy Zones tab, select DNS View -> Zone, and then click Add -> select Block (No Data) Rule -> Block IP address (No Data) Rule.
   or
   From the Data Management tab, select the DNS tab -> Response Policy Zones tab, and then select a zone. Expand the Toolbar, click Add -> select Block (No Data) Rule -> Block IP address (No Data) Rule.
2. The following fields are displayed in the Add a Block IP Address (No Data) Rule wizard:
   - **IP Address or Network**: Enter the IP address or specify the address in CIDR format which you want to block. Click Select Zone to select a different zone.
   - **DNS View**: Displays the DNS view to which the selected RPZ belongs.
   - **Policy**: Displays the selected policy.
   - **Comment**: Optionally, enter additional information.
   - **Disable**: Clear the check box to enable the block rule. Select the check box to disable it.
3. Click Next to define extensible attributes. For information, see About Extensible Attributes.
4. Save the configuration.

Defining Block (No Data) Rules for Client IP Addresses or Networks

To define block rules for client IP addresses or networks:

1. From the Data Management tab, select the DNS tab -> Response Policy Zones tab, select DNS View -> Zone, and then click Add -> select Block (No Data) Rule -> Block Client IP address (No Data) Rule.
   or
   From the Data Management tab, select the DNS tab -> Response Policy Zones tab, and then select a zone. Expand the Toolbar, click Add -> select Block (No Data) Rule -> Block Client IP address (No Data) Rule.
2. The following fields are displayed in the Add a Block Client IP Address (No Data) Rule wizard:
   - **Client IP Address or Network**: Enter the client IP address or specify the client address in CIDR format which you want to block. Click Select Zone to select a different zone.
   - **DNS View**: Displays the DNS view to which the selected RPZ belongs.
   - **Policy**: Displays the selected policy.
   - **Comment**: Optionally, enter additional information.
   - **Disable**: Clear the check box to enable the block rule. Select the check box to disable it.
3. Click Next to define extensible attributes. For information, see About Extensible Attributes.
4. Save the configuration.

Managing Substitute (Domain Name) Rules

You can define an alternate IP address or a domain name to redirect a domain name or an IP address, which is malicious or unauthorized. When the response to the client query matches an RPZ rule, the actual domain name or IP address is substituted with the alternative domain name or IP address.
Defining Substitute Domain Name (Based on Domain Name) Rules

To define substitutes for domain names:

1. From the Data Management tab, select the DNS tab -> Response Policy Zones tab, select DNS_View -> Zone, and then click Add -> select Substitute (Domain Name) Rule -> Substitute Domain Name (Domain Name) Rule.
   
   or
   
   From the Data Management tab, select the DNS tab -> Response Policy Zones tab, and then select a zone. Expand the Toolbar, click Add -> select Substitute (Domain Name) Rule -> Substitute Domain Name (Domain Name) Rule.
   
2. The following fields are displayed in the Add a Substitute (Domain Name) Rule wizard:
   - Name: Enter the domain name for which you want to define a substitute. Click Select Zone to select a different zone.
   - DNS View: Displays the DNS view to which the selected RPZ belongs.
   - Policy: Displays the selected policy.
   - Substituted Name: Enter an alternative domain name or IP address that has to be substituted with the actual domain name.
   - Comment: Optionally, enter additional information.
   - Disable: Clear the check box to enable the substitute rule. Select the check box to disable it.
   
3. Click Next to define extensible attributes. For information, see About Extensible Attributes.
4. Save the configuration.

Defining Substitute Domain Name (Based on IP address) Rules

To define substitutes for IP addresses:

1. From the Data Management tab, select the DNS tab -> Response Policy Zones tab, select DNS_View -> Zone, and then click Add -> select Substitute (Domain Name) Rule -> Substitute Domain Name (IP Address) Rule.
   
   or
   
   From the Data Management tab, select the DNS tab -> Response Policy Zones tab, and then select a zone. Expand the Toolbar, click Add -> select Substitute (Domain Name) Rule -> Substitute Domain Name (IP Address) Rule.
   
2. The following fields are displayed in the Add a Substitute Domain Name (IP Address) Rule wizard:
   - IP address or Network: Enter the IP address or network for which you want to define a substitute. Click Select Zone to select a different zone.
   - DNS View: Displays the DNS view to which the selected RPZ belongs.
   - Policy: Displays the selected policy.
   - Substituted Name: Enter an alternative domain name or IP address that has to be substituted with the actual IP address.
   - Comment: Optionally, enter additional information.
   - Disable: Clear the check box to enable the substitute rule. Select the check box to disable it.
   
3. Click Next to define extensible attributes. For information, see About Extensible Attributes.
4. Save the configuration.

Defining Substitute Domain Name (Based on Client IP address) Rules

You can define a substitute domain name rule for a client IP address if you want to substitute the actual response to a query from the DNS client with an alternate domain name or IP address. When the IP address of the client querying a DNS server matches the RPZ rule, the actual response is substituted with the alternative domain name or IP address specified in the RPZ rule.

To define substitute domain name rule for client IP addresses:

1. From the Data Management tab, select the DNS tab -> Response Policy Zones tab, select DNS_View -> Zone, and then click Add -> select Substitute (Domain Name) Rule -> Substitute Domain Name (Client IP Address) Rule.
   
   or
   
   From the Data Management tab, select the DNS tab -> Response Policy Zones tab, and then select a zone. Expand the Toolbar, click Add -> select Substitute (Domain Name) Rule -> Substitute Domain Name (Client IP Address) Rule.
   
2. The following fields are displayed in the Add a Substitute Domain Name (Client IP Address) Rule wizard:
   - Client IP address or Network: Enter the client IP address or client network for which you want to define a substitute domain name (client IP address) rule. Click Select Zone to select a different zone.
   - DNS View: Displays the DNS view to which the selected RPZ belongs.
   - Policy: Displays the selected policy.
   - Substituted Name: Enter an alternative domain name or IP address that replaces the actual DNS response. Click Select Zone t
To define substitute rules for AAAA records:

An RPZ AAAA (address) record maps a domain name to a substitute IPv6 address. To define a specific name-to-address mapping, add an AAAA record to a previously defined RPZ.

To define substitute rules for AAAA records:

1. From the Data Management tab, select the DNS tab -> Response Policy Zones tab, select DNS_View -> Zone, and then click Add -> select Substitute (Record) Rule -> Substitute (AAAA Record) Rule.

2. The following fields are displayed in the Add a Substitute (AAAA Record) Rule wizard:
   - Name: Enter the domain name that you want to map to an IPv6 address. The name that you specify, irrespective of the RPZ name, is used to determine a match for the RPZ rule. Click Select Zone to select a different zone.
   - DNS View: Displays the DNS view to which the selected RPZ belongs.
   - IP Address: Enter the IPv6 address to which you want the domain name to map.
   - Comment: Optionally, enter additional information about the AAAA record.
   - Disable: Clear the check box to enable the record. Select the check box to disable it.

3. Click Next to define extensible attributes. For information, see About Extensible Attributes.

4. Save the configuration.

Managing Substitute (Record) Rules

You can define a substitute record for a domain name, which is considered malicious. You can define substitutes for the following in a zone:

- A records: For information about defining substitutes for A records, see Defining Substitutes Rules for A Records.
- AAAA records: For information about defining substitutes for AAAA records, see Defining Substitute Rules for AAAA Records.
- MX records: For information about defining substitutes for MX records, see Defining Substitute Rules for MX Records.
- NAPTR records: For information about defining substitutes for NAPTR records, see Defining Substitute Rules for NAPTR Records.
- PTR records: For information about defining substitutes for PTR records, see Defining Substitute Rules for PTR Records.
- SRV records: For information about defining substitutes for SRV records, see Defining Substitute Rules for SRV Records.
- TXT records: For information about defining substitutes for TXT records, see Defining Substitute Rules for TXT Records.
- IPv4 addresses: For information about defining substitutes for IPv4 addresses, see Defining Substitute Rules for IPv4 Addresses or Networks.
- IPv6 addresses: For information about defining substitutes for IPv6 addresses, see Defining Substitute Rules for IPv6 Addresses or Networks.

You can define a substitute for a certain owner name and record type. When you substitute a record for a certain owner name and record type, then responses to queries for that owner name and type are modified to contain the substituted value(s).

Defining Substitutes Rules for A Records

An RPZ A (address) record maps a domain name to a substitute IPv4 address. To define a specific name-to-address mapping, add an A record to a previously defined RPZ.

To define substitute rules for A records:

1. From the Data Management tab, select the DNS tab -> Response Policy Zones tab, select DNS_View -> Zone, and then click Add -> select Substitute (Record) Rule -> Substitute (A Record) Rule. or

2. The following fields are displayed in the Add a Substitute (A Record) Rule wizard:
   - Name: Enter the domain name that you want to map to an IP address. The name that you specify, irrespective of the RPZ name, is used to determine a match for the RPZ rule. Click Select Zone to select a different zone.
   - DNS View: Displays the DNS view to which the selected RPZ belongs.
   - IP Address: Enter the IPv4 address to which you want the domain name to map.
   - Comment: Optionally, enter additional information about the A record.
   - Disable: Clear the check box to enable the record. Select the check box to disable it.

3. Click Next to define extensible attributes. For information, see About Extensible Attributes.

4. Save the configuration.

Defining Substitute Rules for AAAA Records

An RPZ AAAA (address) record maps a domain name to a substitute IPv6 address. To define a specific name-to-address mapping, add an RPZ AAAA record to a previously defined RPZ.

To define substitute rules for AAAA records:

1. From the Data Management tab, select the DNS tab -> Response Policy Zones tab, select DNS_View -> Zone, and then click Add -> select Substitute (Record) Rule -> Substitute (AAAA Record) Rule.

2. The following fields are displayed in the Add a Substitute (AAAA Record) Rule wizard:
   - Name: Enter the domain name that you want to map to an IPv6 address. The name that you specify, irrespective of the RPZ name, is used to determine a match with the RPZ rule. Click Select Zone to select a different zone.
   - DNS View: Displays the DNS view to which the selected RPZ belongs.
   - IP Address: Enter the IPv6 address to which you want the domain name to map.
   - Comment: Optionally, enter additional information about the AAAA record.
   - Disable: Clear the check box to enable the record. Select the check box to disable it.

3. Click Next to define extensible attributes. For information, see About Extensible Attributes.

4. Save the configuration.

Copyright ©2019, Infoblox, Inc. All right reserved.
Defining Substitute Rules for MX Records

An RPZ MX (mail exchanger) record maps a domain name to a mail exchanger. A mail exchanger is a server that either delivers or forwards mail. A wildcard MX record applies to an RPZ and all its subdomains of the owner name.

To define substitute rules for MX records:

1. From the Data Management tab, select the DNS tab -> Response Policy Zones tab, select DNS_View -> Zone, and then click Add -> select Substitute (Record) Rule -> Substitute (MX Record) Rule.
   
or
   From the Data Management tab, select the DNS tab -> Response Policy Zones tab, and then select a zone. Expand the Toolbar, click Add -> select Substitute (Record) Rule -> Substitute (MX Record) Rule.

2. The following fields are displayed in the Add a Substitute (MX Record) Rule wizard:
   - **Mail Destination:** Enter the owner name of the MX record you want to substitute.
   - **DNS View:** Displays the DNS view to which the selected RPZ belongs.
   - **Host Name Policy:** Displays the hostname policy of the selected zone. Ensure that the hostname you enter complies with the hostname restriction policy defined for the zone.
   - **Mail Exchanger:** Enter the fully qualified domain name of the mail exchanger.
   - **Preference:** Select an integer from 10 to 100. The preference determines the order in which a client attempts to contact the target mail exchanger.
   - **Comment:** Optionally, enter additional information about the MX record.
   - **Disable:** Clear the check box to enable the record. Select the check box to disable it.

3. Click Next to define extensible attributes. For information, see About Extensible Attributes.

4. Save the configuration.

Defining Substitute Rules for NAPTR Records

A DNS NAPTR object represents a Naming Authority Pointer (NAPTR) resource record. This resource record specifies a regular expression-based rewrite rule that, when applied to an existing string, produces a new RPZ name or URI.

To define substitute rules for NAPTR records:

1. From the Data Management tab, select the DNS tab -> Response Policy Zones tab, select DNS_View -> Zone, and then click Add -> select Substitute (Record) Rule -> Substitute (NAPTR Record) Rule.
   
or
   From the Data Management tab, select the DNS tab -> Response Policy Zones tab, and then select a zone. Expand the Toolbar, click Add -> select Substitute (Record) Rule -> Substitute (NAPTR Record) Rule.

2. The following fields are displayed in the Add a Substitute (NAPTR Record) Rule wizard:
   - **Domain:** Enter the domain name to which this resource record refers. Make sure that you enter a valid FQDN. Example: test.com, foo.com, etc. The name that you specify, irrespective of the RPZ name, is used to determine a match with the RPZ rule. Click Select Zone to select a different zone.
   - **DNS View:** Displays the DNS view to which the selected RPZ belongs.
   - **Service:** Select a service from the drop-down list. This field specifies the service and protocol that are used to communicate with the host at the domain name.
   - **Flags:** The Flag field indicates whether the current lookup is terminal; that is, the current NAPTR record is the last NAPTR record for the lookup. It also provides information about the next step in the lookup process. The flags that are currently used are:
     - **U:** Indicates that the output maps to a URI (Uniform Record Identifier).
     - **S:** Indicates that the output is a domain name that has at least one SRV record. The DNS client must then send a query for the SRV record of the resulting domain name.
     - **A:** Indicates that the output is a domain name that has at least one A or AAAA record. The DNS client must then send a query for the A or AAAA record of the resulting domain name.
     - **P:** Indicates that the protocol specified in the Service field defines the next step or phase.
   - **Order:** Select an Integer from 10 to 100, or enter a value from 0 to 65535. This value indicates the order in which the NAPTR records must be processed. It processes the record with the lowest value first.
   - **Preference:** Select an Integer from 10 to 100, or enter a value from 0 to 65535. Similar to the Preference field in MX records, this value indicates which NAPTR record the DNS client should process first when the records have the same Order values. It processes the record with the lowest value first.
   - **REGEFX:** The regular expression that is used to rewrite the original string from the client into a domain name. RFC 2915 specifies the syntax of the regular expression. Note that the appliance validates the regular expression syntax between the first and second delimiter against the Python re module, which is not 100% compatible with POSIX Extended Regular Expression as specified in the RFC. For information about the Python re module, refer to [http://docs.python.org/release/2.5.1/lib/module-re.html](http://docs.python.org/release/2.5.1/lib/module-re.html).
   - **Replacement:** This specifies the domain name for the next lookup. The default is a dot (.), which indicates that the regular expression in the REGEX field provides the replacement value. Alternatively, you can enter the replacement value in FQDN format.
   - **Comment:** Optionally, enter additional information about the NAPTR record.
   - **Disable:** Clear the check box to enable the record. Select the check box to disable it.

3. Click Next to define extensible attributes. For information, see About Extensible Attributes.

4. Save the configuration.
Defining Substitute Rules for PTR Records

In a forward-mapping zone, a PTR (pointer) record maps a domain name to another domain name. In an RPZ, a PTR (pointer) record maps an address to a domain name. To define a specific address-to-name mapping, add an RPZ PTR record to a previously defined RPZ.

To define substitute rules for PTR records:

1. From the Data Management tab, select the DNS tab -> Response Policy Zones tab, select DNS_View -> Zone, and then click Add -> select Substitute (Record) Rule -> Substitute (PTR Record) Rule.
   
   or
   
   From the Data Management tab, select the DNS tab -> Response Policy Zones tab, and then select a zone. Expand the Toolbar, click Add -> select Substitute (Record) Rule -> Substitute (PTR Record) Rule.

2. The following fields are displayed in the Add a Substitute (PTR Record) Rule wizard: You can select either Name or IP address from the drop-down list.
   - **Name:** Enter a domain name for which you want to create a pointer to another domain. The name that you specify, irrespective of the RPZ name, is used to determine a match with the RPZ rule. Click Select Zone to select a different zone. The name should be in the following format for RPZ:
     
     ipaddress.in-addr.arpa.
     
     Note that the IP address should be in the reverse format. For example, if the IP address is 10.2.1.4, then the name format for RPZ is 4.1.2.10.in-addr.arpa. The following fields are displayed when you select Name from the drop-down list:
     
     - **DNS View:** Displays the DNS view to which the selected RPZ belongs.
     - **Domain Name:** Enter the domain name to which you want the PTR record to point. Make sure that you enter a valid FQDN. Example: test.com, foo.com, etc.
     - **IP Address:** Enter an IP address for which you want to create a pointer to a domain. The following fields are displayed when you select IP Address from the drop-down list:
       
       - **Zone:** Displays the RPZ you have selected. Click Select Zone to select a different zone.
       - **DNS View:** Displays the DNS view to which the selected RPZ belongs.
       - **Domain Name:** Enter the domain name to which you want the PTR record to point. Make sure that you enter a valid FQDN. Example: test.com, foo.com, etc.
       - **Comment:** Optionally, enter additional information about the PTR record.
     - **Disable:** Clear the check box to enable the record. Select the check box to disable it.

3. Click Next to define extensible attributes. For information, see About Extensible Attributes.

4. Save the configuration.

Defining Substitute Rules for SRV Records

A DNS RPZ SRV object represents an SRV resource record, which is also known as a service record. You can define a substitute for an SRV record. When the response to a user's query matches with an RPZ rule, then the combination of actual service, protocol, domain name and the zone is substituted with a combination of priority, weight, port and target details that you specify.

To define substitute rules for SRV records:

1. From the Data Management tab, select the DNS tab -> Response Policy Zones tab, select DNS_View -> Zone, and then click Add -> select Substitute (Record) Rule -> Substitute (SRV Record) Rule.

   or

   From the Data Management tab, select the DNS tab -> Response Policy Zones tab, and then select a zone. Expand the Toolbar, click Add -> select Substitute (Record) Rule -> Substitute (SRV Record) Rule.

2. The following fields are displayed in the Add a Substitute (SRV Record) Rule wizard:
   - **Display input as:** Select the format in which you want the SRV record to be displayed. When you select RFC 2782 format, the appliance follows the _service._protocol.name format as defined in RFC 2782. When you select Free format, enter the entire name in the Domain field.
   - **Service:** Specify the service that the host provides. You can either select a service from the list or type in a service. If it is not on the list. For example, if you are creating a record for a host that provides FTP service, select _ftp. To distinguish the service name labels from the domain name, the service name is prefixed with an underscore. If the name of the service is defined in RFC 1700, Assigned Numbers, use that name. Otherwise, you can use a locally-defined name. This field is disabled when you select Free Format as the display input.
   - **Protocol:** Specify the protocol that the host uses. You can either select a protocol from the list or type in a protocol. If it is not on the list. For example, if it uses TCP, select _tcp. To distinguish the protocol name labels from the domain name, the protocol name is prefixed with an underscore. This field is disabled when you select Free Format as the display input.
   - **Domain:** If Grid Manager displays a zone name, enter the name here to define an SRV record for a host or subdomain. The displayed zone name can either be the last selected zone or the zone from which you are adding the SRV record. If no zone name is displayed or if you want to specify a different zone, click Select Zone. When there are multiple zones, Grid Manager displays the ZoneSelector dialog box. Click a zone name in the dialog box, and then enter the name to define the SRV record. The SRV record name is used to determine the substitute.
   - **Preview:** After you enter all the information, this field displays the FQDN.
   - **DNS View:** Displays the DNS view to which the selected RPZ belongs.
   - **Priority:** Select or enter an integer from 0 to 65535. The priority determines the order in which a client attempts to contact the target host; the domain name host with the lowest number has the highest priority and is queried first. Target hosts with the same priority are attempted in the order defined in the Weight field.
Defining Substitute Rules for TXT Records

A TXT (text) record contains supplemental information for a host. SPF (Sender Policy Framework) records are specialized RPZ TXT records that identify the servers that send mail from a domain.

To define substitute rules for TXT records:

1. From the Data Management tab, select the DNS tab -> Response Policy Zones tab, select DNS View -> Zone, and then click Add -> select Substitute (Record) Rule -> Substitute (TXT Record) Rule.

2. The following fields are displayed in the Add a Substitute (TXT Record) Rule wizard:
   - Name: Enter the name to define a TXT record for a host or subdomain. The name that you specify, irrespective of the RPZ name, is used to determine a match with the RPZ rule. Click Select Zone to select a different zone.
   - DNS View: Displays the DNS view to which the selected RPZ belongs.
   - Text: Enter the text that you want to associate with the record. It can contain substrings of up to 255 bytes, up to a total of 512 bytes. Additionally, if you enter leading, trailing, or embedded spaces in the text, add quotes around the text to preserve the spaces. For example: " v=spf1 include:corp200.com -all ".
   - Comment: Optionally, enter additional information about the TXT record.
   - Disable: Clear the check box to enable the record. Select the check box to disable it.

3. Click Next to define extensible attributes. For information, see About Extensible Attributes.

4. Save the configuration.

Defining Substitute Rules for IPv4 Addresses or Networks

You can define a substitute for an IPv4 address or a network address. When a client queries for A records of a domain name, if the IP address in A records in the response match the specified address or network, then the response is modified to instead contain the substituted address.

To define substitute rules for IPv4 addresses or networks:

1. From the Data Management tab, select the DNS tab -> Response Policy Zones tab, select DNS View -> Zone, and then click Add -> select Substitute (Record) Rule -> Substitute (IPv4 Address) Rule.

2. The following fields are displayed in the Add a Substitute (IPv4 Address) Rule wizard:
   - IP Address or Network: Enter the IPv4 address which you want to substitute with another IPv4 address. Click Select Zone to select a different zone.

3. Click Next to define extensible attributes. For information, see About Extensible Attributes.

4. Save the configuration.

Defining Substitute Rules for IPv6 Addresses or Networks

You can restrict access to specific IPv6 addresses or networks by providing a substitute IP address. When a client queries for AAAA records of a domain name if the IP addresses in AAAA records in the response match the specified address or network, then the response is modified to instead contain the substituted address.

Note: You cannot define a substitute rule for the same IP address or a network address for which you have already defined a passthru rule.

- DNS View: Displays the DNS view to which the selected RPZ belongs.
- Policy: Displays the selected policy.
- Substituted IP Address: Enter the IPv4 address that must be returned to the user when the response matches the A records.
- Comment: Optionally, enter additional information about the IPv4 address.
- Disable: Clear the check box to enable the record. Select the check box to disable it.

3. Click Next to define extensible attributes. For information, see About Extensible Attributes.

4. Save the configuration.
To define substitute rules for IPv6 addresses or networks:

1. From the Data Management tab, select the DNS tab -> Response Policy Zones tab, select DNS_View -> Zone, and then click Add -> select Substitute (Record) Rule -> Substitute (IPv6 Address) Rule.
   or From the Data Management tab, select the DNS tab -> Response Policy Zones tab, and then select a zone. Expand the Toolbar, click Add -> select Substitute (Record) Rule -> Substitute (IPv6 Address) Rule.
2. The following fields are displayed in the Add a Substitute (IPv6 Address) Rule wizard:
   - **IP Address or Network:** Enter the IPv6 address or the network address which you want to substitute with another IP address.
   - **DNS View:** Displays the DNS view to which the selected RPZ belongs.
   - **Policy:** Displays the selected policy.
   - **Substituted IP Address:** Enter the IPv6 address that must be returned to the user when the response matches the AAAA records.
   - **Comment:** Optionally, enter additional information about the IPv6 address.
   - **Disable:** Clear the check box to enable the record. Select the check box to disable it.
3. Click Next to define extensible attributes. For information, see About Extensible Attributes.
4. Save the configuration.

### Configuring Infoblox Threat Intelligence Feed

Starting with NIOS 7.3.200, Infoblox introduces the Infoblox Threat Intelligence Feed, a threat feed subscription for RPZ updates that offer protection against malicious hostnames. Contact your Infoblox representative for pricing and availability information.

When you upgrade from a previous NIOS release to NIOS 7.3.200 and later releases, the Infoblox RPZ feeds you configured in the previous NIOS release are migrated to the upgraded release. For information about the old RPZ feeds, refer to the NIOS 7.3.4 and earlier NIOS Administor Guides.

You can configure the Threat Intelligence Feed and receive reputation RPZ updates on a regular basis. An RPZ feed receives response policies from the Infoblox in-house threat intelligence team, which produces reputation RPZ data and transfers the data to Grid name servers through zone transfers with or without a TSIG key. To ensure proper authentication and integrity of the RPZ feed zone transfers, using a TSIG key is recommended.

**Note:** TSIG Key is used for authentication when downloading information about threat protection feeds. If you have a complex configuration, such as using standalone appliances or Grids that receive threat protection feeds from other standalone appliances or Grids and not directly from the Infoblox distribution servers, ensure that you use the same TSIG key for the RPZ feed zone transfers.

Note that the RPZ feed must have an external primary name server before you can configure it. To propagate RPZs as quickly as possible, the secondary DNS server needs an address to which the RPZ source feed can send NOTIFY messages. For example, if the secondary DNS server is configured behind a NAT, you may want to establish a one-to-one NAT for the lead secondary DNS server so it can receive NOTIFY messages from the RPZ source feed. Otherwise, the lead secondary DNS server will need to periodically poll the RPZ source feed, which could take longer than expected.

**Note:** To enter IDNs (Internationalized Domain Name) in an RPZ feed, you can use the punycode representation of the IDN.

To configure the Threat Intelligence Feed:

1. From the Data Management tab, select the DNS tab -> Response Policy Zones tab, and then click the Add icon.
2. When you click the Add icon, either the Add Response Policy Zone Wizard or the Add DNS View wizard is displayed based on the following:
   - When you click the Add icon, the Add Response Policy Zone Wizard is displayed, if you have not created additional DNS views and only have the default view.
   - If you have configured multiple DNS views, you must drill-down to the corresponding DNS_View to assign an RPZ feed. Click the Add icon and the Add Response Policy Zone Wizard is displayed. To create a new DNS view for your RPZ feed, click the Add icon, and complete the details in the Add DNS View wizard. For information, see Configuration Example: Configuring a DNS View. For information on modifying an existing view, see Modifying DNS Views.
3. In the Add Response Policy Zone Wizard, select Add Response Policy Zone Feed, click Next and specify the following:
   - **Name:** Enter the name of the Infoblox RPZ feed. It can be a combination of alphanumeric characters. You can enter up to 256 characters. For more information, see Infoblox Threat Intelligence Feeds.
   - **DNS View:** The name of the view that you have selected is displayed by default. You can select a view from the drop-down list to associate it with the RPZ feed.
   - **Policy Override:** Select a value from the drop-down list. You can override the policy actions that are specified in the rule level.
     - **Log Only (Disabled)** — Select this if you want to disable an RPZ rewrite using rules in the RPZ zone. If the response to the recursive query matches any RPZ rule, the rule is logged, but the response will not be altered. You cannot overwrite the response to the user. Note that this option will not override RPZ rules in other RPZ zones, if they take precedence.
     - **None (Given)** — Select this if you want to use the policy from the rule level.
     - **Block (No Data)** — Select this if you want the user to receive a response that indicates that there is no data.
     - **Block (No Such Domain)** — Select this if you want the user to receive a NXDOMAIN as the DNS response. All the policy actions in an RPZ are replaced with a NXDOMAIN block.
     - **Passthru** — Select this if you want the user to see the actual response without modification. All the policy actions in an RPZ are replaced with the passthru action.
• **Substitute (Domain Name)** – Select this if you want to replace all the policy actions in an RPZ with the substitution action that is specified.
  • **Domain Name**: This appears only when you select **Substitute (Domain Name)** from the **Policy Override** list. Enter the domain name that you want the client to receive instead of the actual domain name, which is malicious or unauthorized.

• **Severity**: Select the threat severity level for the RPZ zone. The threat severity you select here determines the severity for the RPZ rule. Select **Critical**, **Major**, **Warning**, or **Informational**. The default threat severity level is Major. Note that each of these levels is represented by a number in the syslog (8 being Critical and 4 being Informational). When you upgrade to NIOS 7.0.0, the appliance automatically updates the threat severity level to Informational (displayed as 4 in the syslog) for existing RPZ zones. For information about RPZ syslog messages and severity levels, see **Viewing RPZ in the Syslog**.

• **Comment**: Optionally, enter additional information about the Infoblox RPZ feed.

• **Disable**: Select the check box to disable the RPZ feed without deleting its configuration. Clear the check box to enable the RPZ feed. For information, see **Enabling and Disabling Zones**.

• **Lock**: Select the check box to lock the RPZ feed so that you can make changes to it and prevent others from making conflicting changes. For information, see **Locking and Unlocking RPZs**.

4. Click **Next** to associate the RPZ feed with at least one external primary name server and a secondary name server:

• Define name servers for the RPZ feed. An RPZ feed must have at least one RPZ source as an external primary name server and at least one Grid secondary name server. For external primary servers, specify the following:
  • **Name**: Enter the zone name of the primary name server.
  • **Address**: Enter the name server IP address provided by Infoblox for the RPZ feed.
  • **Use TSIG**: Select the check box to specify TSIG settings.
  • **Key Name**: Enter the TSIG Key Name provided by Infoblox.
  • **Algorithm**: Select `hmac-md5`.
  • **Key Data**: Enter the TSIG string provided by Infoblox.
  Note that either the Grid name server or the DNS view must be recursive for the RPZ feed. You can associate a lead secondary with an RPZ feed. For information on specifying primary and secondary, see **Assigning Zone Authority to Name Servers**. When you select **All Recursive Name Servers** from the list, all the recursive name servers in the Grid are added as secondary servers for the zone. For information about all recursive name servers, see **Configuring RPZs for All Recursive Servers**. For information on specifying name server groups, see **About Name Server Groups**.

5. Save the configuration and click **Next** to define extensible attributes. Click **Restart** if it appears at the top of the screen. For information, see **About Extensible Attributes**.

**Infoblox Threat Intelligence Feeds**

Infoblox RPZ feeds are categorized into pure malicious feeds and combination feeds. All the feeds listed below are set to return NXDOMAIN for items in the feed. Threat data changes are pushed every 20 minutes from the DNS servers and significant changes are typically made every two hours.

The following tables list the Infoblox Threat Intelligence feeds:

**Table 42.1 Pure Malicious Feeds**

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Base (base.rpz.infoblox.local)</td>
<td>Enables protection against known hostnames that are dangerous as destinations, such as APT, Bot, Compromised Host/Domains, Exploit Kits, Malicious Name Servers, and Sinkholes along with bogon IP addresses.</td>
</tr>
<tr>
<td>AntiMalware (antimalware.rpz.infoblox.local)</td>
<td>Enables protection against known malicious threats that can take action on or control of your system, such as Malware Command &amp; Control, Malware Download, and active Phishing sites.</td>
</tr>
<tr>
<td>Ransomware (ransomware.rpz.infoblox.local)</td>
<td>Enables protection against ransomware that restricts access to the computer system that it infects, and demands a ransom paid to the creator of the malware in order for the restriction to be removed. Some forms of ransomware encrypt files on the system's hard drive, while some may simply lock the system and display messages intended to coax the user into paying. Examples include Locky, CryptoLocker, Dircrypt, and CryptoWall.</td>
</tr>
<tr>
<td>Bogon (bogon.rpz.infoblox.local)</td>
<td>Enables protection against bogons, which are commonly found as the source addresses of DDoS attacks. A bogon is an informal name for an IP packet on the public Internet that claims to be from an area of the IP address space reserved, but not yet allocated or delegated by the Internet Assigned Numbers Authority (IANA) or a delegated Regional Internet Registry (RIR). The areas of unallocated address space are called bogon space. Many ISPs and end-user firewalls filter and block bogons, because they have no legitimate use, and usually are the result of accidental or malicious misconfiguration.</td>
</tr>
</tbody>
</table>
AntiMalware_IP (antimalware-ip.rpz.infoblox.local) Enables protection against known malicious or compromised IP addresses. These are known to host threats that can take action on or control of your system, such as Malware Command & Control, Malware Download, and active Phishing sites.

Bot_IP (bot-ip.rpz.infoblox.local) Enables protection against self-propagating malware designed to infect a host and connect back to a central server or servers that act as a command and control (C&C) center for an entire network of compromised devices, or "botnet." With a botnet, attackers can launch broad-based, "remote-control," flood-type attacks against their target(s). Bots can also log keystrokes, gather passwords, capture and analyze packets, gather financial information, launch DoS attacks, relay spam, and open back doors on the infected host.

ExploitKit_IP (exploitkit-ip.rpz.infoblox.local) Enables protection against distributable packs that contains malicious programs that are used to execute "drive-by-download" attacks in order to infect users with malware. These exploit kits target vulnerabilities in the users' machines (usually due to unpatched versions of Java, Adobe Reader, Adobe Flash, Internet Explorer, ...) to load malware onto the victim's computer.

Malware_DGA (malware-dga.rpz.infoblox.local) Domain generation algorithm (DGA) are algorithms seen in various families of malware that are used to periodically generate a large number of domain names that can be used as rendezvous points with their command and control servers. Examples include Ramnit, Conficker, and Banjoni.

TOR_Exit_Node_IP (tor-exit-node-ip.rpz.infoblox.local) Tor Exit Nodes are the gateways where encrypted Tor traffic hits the Internet. This means an exit node can be used to monitor Tor traffic (after it leaves the onion network). It is in the design of the Tor network that locating the source of that traffic through the network should be difficult to determine.

SURBL_Multi (multi-domain.surbl.rpz.infoblox.local) Blacklist of Malicious Domains including up-to-date intel on active malware, phishing, botnet, and spam domains. Based on data provided by our partner SURBL.

SURBL_Fresh (fresh-domain.surbl.rpz.infoblox.local) Newly Observed Domains. SURBL Fresh feed provides critical, accurate, information on the time new domains are placed into service. Security policy can be easily applied (block, quarantine, walled garden, etc.) to prevent resolution of new domains, based on the user's defined policies. Based on data provided by our partner SURBL.

### Downloading Rules for an RPZ Feed

You can perform a zone transfer to transfer the rules from an external primary name server to the RPZ feed. You cannot modify these rules, but you can override the entire ruleset or an individual rule. However, if you import a zone to a local zone, you can edit the rules within a local zone. The feed zone supports NSIP and NSDNAME rules; however local RPZs do not support these rules. To download rules from an external primary name server:

1. From the Data Management tab, select the DNS tab -> Response Policy Zones tab, and then click the corresponding RPZ Feed.
2. In the Export dialog box, complete the following:
   - Separator: Select the separator used in the data file. The default value is Comma.
   - Click Export.

All the rules are transferred. You can download rules only if the lead secondary has completed at least one zone transfer from the external primary. You can either open the data file or save it to your computer. The rules are displayed for the selected RPZ feed in the Rule wizard. After you have downloaded rules from an RPZ feed, you can test RPZ feed policies, as described in Testing RPZ Feed Rules.

### Testing RPZ Feed Rules

After you have downloaded rules from an RPZ feed, you can test the downloaded policies by using the dig command and observing log messages that contain redirect or rewrite responses in the syslog. The NIOS appliance supports generation of RPZ log messages in CEF (Common Event Format). Note that non-RPZ messages cannot be generated in CEF.

You must enable the rpz option in the Logging Category of the Grid DNS Properties editor to receive RPZ related messages in the syslog. For information about configuring the logging category, see Setting DNS Logging Categories.

To view RPZ log messages in the syslog, you can use the system filter RPZ Logs from the Quick Filter to filter the messages. Note that only messages in CEF are displayed.

To view RPZ log messages:

1. From the Administration tab, select the Logs tab -> Syslog tab.
2. From the drop-down list at the upper right corner, select the Grid member on which you want to view the syslog.
3. Click Show Filters to enable the filters. Select RPZ Logs from the Quick Filter drop-down list to narrow down the system messages you want to view.

The name server recursive cache makes a syslog entry when an RPZ functionality fails. The syslog message log format is as follows:

```
rpz <TYPE> rewrite <QUERY> via <RPZ_RECORD><ERROR_MESSAGE>
```

where: <TYPE> is one of following RPZ action types: QNAME, IP, NSIP, NSDNAME, CLIENT-IP;
<QUERY> is a query record to process;
<RPZ_RECORD> is an RPZ record that is used to perform an action to the query;
<ERROR_MESSAGE> is a message with error details. Example: NS address rewrite rrset failed:, concatenate() failed:, NS db_find() failed:, stop on qresult in rpz_rewrite() failed:, stop on unrecognized qresult in rpz_rewrite() failed:, etc.

To test RPZ feed policies:

1. Open a terminal console on your computer.
2. Type the command `dig @<your DNS server IP> <queried domain>`.
3. Go to the Administration tab -> Logs tab -> Syslog tab to view CEF log messages.

About FireEye Integrated RPZs

Infoblox DNS Firewall provides a mechanism to further protect your network from malware and APTs (Advanced Persistent Threats) through the integration of FireEye appliances. When your NIOS appliance is properly integrated with a FireEye appliance, it receives periodic alerts and APTs from the FireEye appliance when it identifies such threats. Based on your configuration, the NIOS appliance translates these alerts into RPZ rules that not only further protect your network from malicious attacks, but also aid in identifying clients that have been compromised.

As illustrated in Figure 42.2, after installing the required RPZ and FireEye licenses on the NIOS appliance, you can configure a FireEye integrated RPZ in which you map RPZ rules to FireEye alert types. While creating the FireEye RPZ, the appliance generates a URL to which the FireEye appliance sends alerts. Ensure that you enter this URL when configuring the FireEye appliance. The NIOS appliance also creates the fireeye-group admin group after you define the first FireEye RPZ. You can add multiple admin users to this admin group. Note that users in the fireeye-group can only send alerts to the NIOS appliance; they cannot access the Infoblox GUI, CLI, API and RESTful API. They also do not have permissions to perform other tasks on the appliance. Ensure that you record the usernames and passwords for all user accounts so you can enter them correctly when you configure the FireEye appliance. You can map a single or multiple FireEye appliances to a NIOS appliance where multiple users or zones exist.

To configure a FireEye integrated RPZ, complete the following:

1. Create a new FireEye integrated RPZ, as described in Configuring FireEye RPZs.
2. Create FireEye admin users, as described in FireEye Integrated RPZs.
3. Add URL and user credentials on the FireEye appliance, as described in Configuring the FireEye appliance.
4. When a malware or threat is detected, the FireEye appliance sends an alert message to the NIOS appliance, which is stored in the syslog. For more information, see Handling Alerts from the FireEye appliance.

Configuring FireEye RPZs

You must create an RPZ zone and map the FireEye alerts with an RPZ rule to receive alerts from FireEye. These alerts will then be translated into appropriate RPZ rules that are added to the FireEye RPZ. You can also define a time limit for a specific alert type or set the alert type to live forever. When you define a lifetime, the alert type will be active for the specified number of days or weeks in the NIOS appliance, and will then expire after the specified time. After you configure the FireEye integrated RPZ, the NIOS Grid receives alerts from the FireEye appliance and creates RPZ rules for some of the alerts received. FireEye appliance sends alert messages with basic authentication. You must configure a username and password on the NIOS appliance prior to receiving any alerts from the FireEye appliance.

Note: The NIOS appliance treats the FireEye integrated RPZ as a local RPZ. Thus, you cannot assign an external primary name server to the zone.

An alert contains the malware URL along with a valid FQDN. The NIOS appliance can only map an alert to a RPZ rule if the FQDN is present. If an alert doesn’t contain the FQDN, then the alert is ignored by the NIOS appliance. For more information about alerts, see Handling Alerts from the FireEye appliance. Once the alert is processed and properly mapped to an RPZ rule, it remains in the database until you delete it manually. You
can get more information about the alerts, which are sent by the FireEye appliance, from the syslog.

**Note:** You can configure feeds from multiple FireEye appliances. To enable or disable FireEye integration module feeds from individual appliances, you must enable or disable user access of the particular FireEye appliance. Note that the FireEye feeds will not be in the RPZ format, but when you configure a FireEye integrated RPZ, the NIOS appliance creates a new URL through which the FireEye appliance sends alerts.

To configure a FireEye integrated RPZ:

1. From the Data Management tab, select the DNS tab -> Response Policy Zones tab, and then click the Add icon.
2. When you click the Add icon, either the Add Response Policy Zone Wizard or the Add DNS View wizard is displayed based on the following:
   - When you click the Add icon, the Add Response Policy Zone Wizard is displayed if you have not created additional DNS views and only have the default view.
3. If you have configured multiple DNS views, you must drill-down to the corresponding view to assign a FireEye Integrated RPZ. Click the Add icon and complete the details in the Add DNS View wizard. To create a new DNS view for your FireEye integrated RPZ, click the Add icon and complete the details in the Add DNS View wizard. For information, see Adding a DNS View. For information on modifying an existing view, see Modifying DNS Views.
4. In the Add Response Policy Zone Wizard, select Add FireEye-Integrated Response Policy Zone, click Next and specify the following:
   - **Name:** Enter the name of the FireEye integrated RPZ. It can be a combination of alphanumeric characters. You can enter up to 256 characters.
   - **DNS View:** The name of the view that you have selected is displayed by default. You can select a view from the drop-down list to associate it with the FireEye integrated RPZ.
   - **Policy Override:** Select a value from the drop-down list. You can override the policy actions that are specified in the rule level.
     - **Log Only (Disabled)** – Select this if you want to disable an RPZ rewrite using rules in the RPZ. If the response to the recursive query matches any RPZ rule, then the rule is logged, but the response will not be altered. Note that this option will not override RPZ rules in other RPZ zones, if they take precedence. Select this option to preview the rules in the syslog before they take effect.
     - **None (Given)** – Select this if you want to use the policy from the rule level.
     - **Block (No Data)** – Select this to send a response that contains no data in it.
     - **Block (No Such Domain)** – Select this if you want to receive a DNS response that indicates there is no domain. All the policy actions in an RPZ are replaced with a NXDOMAIN block.
     - **Passthru** – Select this if you want to send an actual response without modification. All the policy actions in an RPZ are replaced with the passthru action.
     - **Substitute (Domain Name)** – Select this if you want to replace all the policy actions in an FireEye integrated RPZ with the specified substitution action.
       - **Domain Name:** This appears only when you select Substitute (Domain Name) from the Policy Override list. Enter the domain name that you want the client to receive instead of the actual domain name, which is malicious or unauthorized.
       - **Comment:** Optionally, enter additional information about the FireEye integrated RPZ.
   - **Disable:** Select the check box to disable the FireEye integrated RPZ without deleting its configuration. Clear the check box to enable the FireEye integrated RPZ. For information, see Enabling and Disabling Zones.
5. Click Next to define rule mapping:
   - **Server URL:** The appliance displays the URL that you use when configuring the FireEye appliance. This URL is used to handle alerts, which is sent by the FireEye appliance. It handles alerts based on the standard authentication. The URL generated by the NIOS appliance consists of the Grid Manager IP address, network view, and DNS view of the FireEye zone. If you change the IP address, network view, zone or DNS view after you have configured a FireEye RPZ, the URL will change accordingly. Thus FireEye will not be able to send alerts to the updated URL. You must update the URL in the FireEye appliance to send alerts to the NIOS appliance. The Server URL is generated in this format:

     https://<host address>/alert/feye/<network view>/<dns view>/<zone>

   - **Rule Mapping:** You can map a FireEye alert type with an RPZ policy. Select an RPZ policy type from the drop-down list. Note that the FireEye alert type is read-only. The NIOS appliance applies corresponding RPZ policy type when the FireEye appliance sends an alert to the NIOS appliance. You can also specify a time limit for each FireEye RPZ rule depending on the FireEye alert type. NIOS displays default lifetime value for each alert type. You can change the default lifetime of the alert type. When you define a value, the value must be greater than zero. When you select Live Forever from the drop-down list, the alert type will never expire and will be stored in the database until further notice. The NIOS appliance will use the default time if you do not specify a value. You can specify the expiration time in days or weeks only. The following table lists the FireEye alerts, RPZ policy types, and the time limit for a specific FireEye alert:

<table>
<thead>
<tr>
<th>FireEye Alert Type</th>
<th>RPZ Policy Type</th>
<th>Lifetime</th>
</tr>
</thead>
</table>

Table 4.2.2 FireEye Rule Mapping

Copyright ©2019, Infoblox, Inc. All right reserved.
When you edit the lifetime of an existing alert type, NIOS deletes the alert type based on the new lifetime setting. It also updates the expiration time for the corresponding alert type. Note that there might be an impact on the performance when you delete expired FireEye RPZ rules.

- **Override rule mapping for APT events**: Select a value from the drop-down list to override rule mapping for Advanced Persistent Threats. Events that are marked as APT events by FireEye override rules that are set for other event types. The values in the drop-down list are:
  - **No Override** – Select this if you want to use the policy from the rule level and do not want to override the rule mapping settings. This value is displayed in the drop-down list, by default.
  - **Passthru** – Select this if you want the user to see the actual response without modification. All the policy actions in an RPZ are replaced with the passthru action.
  - **Block (No Such Domain)** – Select this if you want the user to receive a NXDOMAIN as the DNS response. All the policy actions in an RPZ are replaced with a NXDOMAIN block.
  - **Block (No Data)** – Select this if you want the user to receive a response that indicates that there is no data.
  - **Substitute (Domain Name)** – Select this if you want to replace all the policy actions in an RPZ with the substitution action that is specified.
  - **Substituted Domain Name**: This appears only when you select Substitute (Domain Name) from the Policy Override list either for APT events or for FireEye alerts. Enter the domain name that you want the client to receive instead of the actual domain name, which is malicious or unauthorized.

6. Click **Next** to associate the FireEye integrated RPZ with at least one primary name server:

   - Define the name servers for the FireEye integrated RPZ. A Grid name server must be recursive when primary Grid name server is used as an RPZ source. A FireEye integrated RPZ may or may not have a recursive server. For example, there could be a Grid that has only primary Grid name server for a FireEye integrated RPZ to act as an RPZ source for an external set of name servers. A FireEye integrated RPZ must have only one primary Grid name server and it can have one or more secondary Grid name servers. When you select **All Recursive Name Servers** from the list, all the recursive name servers in the Grid are added as secondary servers for the zone. For information on specifying primary or secondary name servers, see **Assigning Zone Authority to Name Servers**. For information on specifying name server groups, see **About Name Server Groups**. For information about all recursive name servers, see **Configuring RPZs for All Recursive Servers**.

7. Save the configuration and click **Next** to define extensible attributes. For information, see **About Extensible Attributes**.

8. Click **Restart** if it appears at the top of the screen.

### Configuring Rules for FireEye RPZs

You can define a list of rules based on how the DNS server determines its response to recursive queries. Based on the rules defined, responses to clients are either manipulated or forwarded without any changes. To configure rules for FireEye RPZs:

1. From the **Data Management** tab, select the **DNS** tab -> **Response Policy Zones** tab, click **DNS View** -> **Zone** and then click **Add** -> select a **Rule**.
2. The rules are classified as follows:
   - **Passthru Rule**: For information, see **Managing Passthru Rules**.
   - **Block (No Such Domain) Rule**: For information, see **Managing Block (No Such Domain) Rules**.
   - **Block (No Data) Rule**: For information, see **Managing Block (No Data) Rules**.
   - **Substitute (Domain Name) Rule**: For information, see **Managing Substitute (Domain Name) Rules**.
   - **Substitute (Record) Rule**: For information, see **Managing Substitute (Record) Rules**.
3. Complete the details in the corresponding editor.
4. Save the configuration and click **Next** to define extensible attributes. For information about extensible attributes, see **About Extensible Attributes**.

### Configuring the FireEye appliance

You must configure the FireEye appliance to send alerts to the NIOS appliance. Ensure that the following are complete before you configure the FireEye appliance:
1. Install required license on the NIOS appliance. For more information about license, see License Requirements and Admin Permissions.
2. Create a new FireEye RPZ zone. For more information, see Configuring FireEye RPZs.
3. Create FireEye admin users. For more information, see For FireEye Integrated RPZs.
4. Get the URL from the NIOS appliance and record it. You need this to configure the FireEye appliance. For more information about the Server URL, see Configuring FireEye RPZs. If you have already configured a FireEye integrated RPZ, then you can retrieve the URL through the FireEye tab of the corresponding FireEye RPZ zone. For more information about managing and retrieving the URL, see Modifying RPZs.
5. Record the usernames and passwords on the NIOS appliance. You must use these credentials when configuring FireEye alerts to enable the alerts to be received by NIOS. For more information, see Configuring the FireEye appliance to send alerts to NIOS.

**Configuring the FireEye appliance to send alerts to NIOS**

You must configure the NIOS generated URL, usernames and passwords on the FireEye appliance. FireEye appliance embeds the configured usernames and passwords in the alerts for authentication. When an alert is received, the NIOS appliance verifies the FireEye username prior to processing the alert. Note that the NIOS appliance accepts alerts sent by the FireEye appliance in JSON Normal format only. To configure a FireEye appliance:

1. Login to the FireEye appliance with your username and password.
2. In the FireEye GUI, click Settings tab and then click the Notifications tab on the left panel.
3. In the Notification Settings page, click the http link and then enter the name of the HTTP server you want to add. Click Add HTTP Server and complete the following:
   - **Name:** When you click add, the HTTP server name that you specified is listed in this column.
   - **Enabled:** Select the check box to enable alerts and notifications for the HTTP server.
   - **Server Url:** Enter the URL you received on the NIOS appliance. The alerts and notifications are sent using this URL by the FireEye appliance.
   - **Auth:** Select this check box if authentication is required for the server.
   - **Username and Password:** Enter the Username and Password of the user that you have configured for the fireeye-group on the NIOS appliance. For more information, see For FireEye Integrated RPZs.
   - **Notification:** Select a notification from the drop-down list. You can choose to include notifications for all events or only events of a selected type. The FireEye appliance will send an alert to the NIOS appliance only when selected event is encountered. When you select All Events, alerts are sent when each event is encountered by the FireEye appliance.
   - **Delivery:** Select Per Event from the drop-down list. Note that the NIOS appliance supports only Per Event selection. The FireEye appliance sends an alert each time it encounters an event.
   - **Account:** You can specify a user account name for this notification.
   - **SSL Enable:** Select this check box to enable SSL for secure transmission of alerts from the FireEye appliance to NIOS.
   - **Default Provider:** Select a default provider from the list.
   - **Message Format:** Select JSON Normal from the drop-down list. Note that the NIOS appliance supports only this message format.
4. Click Update at the bottom of the page.

**Note:** You can also click Test-Fire to test the configuration. If the configuration is successful, FireEye sends a confirmation message to the NIOS appliance and the NIOS appliance logs this message in the syslog. It generally takes a few seconds for the NIOS appliance to receive alerts. You must verify the configuration, if there is no entry in the syslog.

**Handling Alerts from the FireEye appliance**

The NIOS appliance processes each alert that it receives from the FireEye appliance. The alert contains the malware URL along with a valid FQDN. NIOS appliance can only map an alert to a RPZ rule if the FQDN is present. Once the alert is processed and properly mapped to an RPZ rule, it remains in the database until you delete it manually. When the RPZ rule is different from the existing rules, the new RPZ rule gains precedence over the existing RPZ rule in the FireEye integrated RPZ. Note that you cannot retrieve alerts that are ignored. You can get more information about the alerts, which are sent by the FireEye appliance, from the syslog. An alert will not be processed and will be ignored:

- when there are changes to the URL or if the alert does not have the malware URL or FQDN in them.
- if the zone is not found.
- if the alert is sent without any username in it or if the username does not belong to the fireeye-group.
- if a FireEye admin user is deleted. NIOS will neither authenticate the deleted user credentials nor process any future alerts with deleted user credentials.
- if the search mapping fields contain IP addresses other than FQDNs.
- if alerts contain domain names in an IPv4 or IPv6 address format.

**Logging FireEye Integrated RPZ messages**

The NIOS appliance logs FireEye events and alerts in the syslog and audit log. Each FireEye feed event is logged every time an alert is sent to NIOS by the FireEye appliance. When you create a new rule or update an existing rule, then those are also logged in the syslog. You can use messages logged in syslog to verify events that are related to communication between the FireEye and NIOS appliances. It also enables the admin to monitor alerts and verify how the alerts are processed. Details about alerts that are received and processed are also logged. Syslog messages are logged when:
• an alert is received from the FireEye appliance.
• syslog messages contain required information for reporting.
• an alert is successfully mapped to an RPZ rule. The message format is as follows:
  • <FireEye: Found an APT alert>
• the NIOS appliance cannot process alerts. For example, alert structure mismatch, unrecognizable data, etc. The messages will have the following format:
  • <FireEye: Cannot parse FQDN due to missing field"cnc-services”>
  • <FireEye: Cannot determine if it is an APT alert...>
  • <FireEye: Invalid Alert Type .....>
  • <FireEye: Couldn't find the required field...>
  • <FireEye: No mapping rule has been set for alert type.....>
• a duplicate alert is sent by the FireEye appliance for which the same RPZ rule already exists.

Note: For debugging purposes, alert messages will be displayed in the infoblox.log file.

NIOS periodically scans the syslog of a member that has RPZ license installed to generate recent hits data for the RPZ Recent Hits tab. This might cause a performance impact as CPU cycles will be used on the member. For more information about RPZ Recent Hits tab, see RPZ Recent Hits.

Configuration Examples

This section illustrates some of the examples of local and FireEye integrated RPZs.

Local RPZ Examples

Following is an example of an IP related rule. For example, execute the following command:

dig @10.35.104.19 abc.net

If the above command returns 18.58.20.1, then define an IPv4 substitute rule 18.0.0.0/8, Substitute (IPv4) 8.8.8.89.

Execute the command dig @10.35.104.19 abc.net again. You will receive the substituted address instead of the actual domain name.

Following is an example of values in CEF for the above substitution example:

2012-11-06T19:04:02+00:00 daemon (none) named[25193]: info
CEF:0|Infoblox|NIOS|6.6.0-185622|RPZ-IP|records|4|app=DNS dst=10.35.104.19
src=10.32.0.242 spt=50035 view=_default qtype=A msg="rpz IP records rewrite abc.net [A] via 8.0.0.18.rpz-ip.localrpz"

Following is an example of values in the CEF for Block (No Data) rules:

2012-11-06T19:00:01+00:00 daemon (none) named[25193]: info
CEF:0|Infoblox|NIOS|6.6.0-185622|RPZ-QNAME|NODATA|4|app=DNS dst=10.35.104.19
src=10.32.0.242 spt=50035 view=_default qtype=A msg="rpz QNAME NODATA rewrite nodata.net [A] via nodata.net.localrpz"

You can view the NIOS version, name of the view, source, and destination.

FireEye Integrated RPZ Examples

Following is an example of a syslog message when an alert gets converted to an RPZ rule:

2013-09-11T10:59:55-07:00 user (none) httpd[]: info fireeye-rpt:
'79167','infection-match','minr''eng-lab-249.inca.infoblox.com'

2013-09-11T10:59:55-07:00 user (none) httpd[]: info FireEye: Create an RPZ rule for 'd.bnksw.com' with 'SUBSTITUTE' rule in RPZ zone 'com.lock'

Note that the domain name lock.com is displayed in the reverse format.

Following is an example of a syslog message when an alert is ignored by the NIOS appliance:

2013-09-11T11:04:01-07:00 user (none) httpd[]: info fireeye-rpt:
Example of a basic RPZ Workflow

Following is an example of a basic RPZ workflow:

1. Install the RPZ license. For more information, see License Requirements and Admin Permissions.
2. Enable recursive queries for a DNS view, member, or Grid, as described in Enabling Recursion for RPZs.
3. Enable RPZ logging in the Grid DNS Properties editor to view syslog entries for RPZ queries. For more information, see Setting DNS Logging Categories.
4. Create a local RPZ. For more information, see Configuring Local RPZs.
5. Define a Substitute (PTR Record) Rule for domain name 3.3.3.5.in-addr.arpa, which is substituted with the domain name ptr1.com. For more information, see Defining Substitute Rules for PTR Records.
6. Execute the dig command to view output. The output contains the substituted domain name ptr1.com. Following is the output of an RPZ query for Substitute (PTR Record) Rule:

   $ dig @10.36.2.73 3.3.3.5.in-addr.arpa in ptr
   ; <<>> DiG 9.6.2-P2-RedHat-9.6.2-5.P2.fc12 <<>> @10.36.2.73 3.3.3.5.in-addr.arpa in ptr
   ; (1 server found)
   ;; global options: +cmd
   ;; Got answer:
   ;; ;>HEADER< opcode: QUERY, status: NOERROR, id: 7351
   ;; flags: qr rd ra; QUERY: 1, ANSWER: 1, AUTHORITY: 0, ADDITIONAL: 0

   ;; QUESTION SECTION:
   ; 3.3.3.5.in-addr.arpa. IN PTR

   ;; ANSWER SECTION:
   3.3.3.5.in-addr.arpa. 7200 IN PTR ptr1.com.

7. Following is the syslog entry for the query mentioned above:

   2013-09-27T02:26:46-04:00 daemon (none) named[21737]: info
   CEF:0|Infoblox|NIOS|6.9.0-218052|RPZ-QNAME|Local-Data|4|app=DNS dst=10.36.2.73
   src=10.120.20.194 spt=40518 cmd=INQ view=2 qtype=PTR msg="rpz QNAME Local-Data rewrite
   3.3.3.5.in-addr.arpa [PTR] via 3.3.3.5.in-addr.arpa.local1.com"

For more information about syslog, see Viewing RPZ in the Syslog.

Mitigating Cyber Threats using TAXII

To mitigate the increasingly complex cyber attacks, you can enable the appliance to run a TAXII (Trusted Automated eXchange of Indicator Information) service to receive information on real-time threat incidents. The information in each threat incident is represented using the STIX (Structured Threat Information eXpression) language format. STIX is a standard language used to describe structured cyber threat information, which is shared between different TAXII clients.

When you run the TAXII service on a Grid member, the appliance acts as a TAXII server that receives TAXII messages (for one or more specified STIX collection) from TAXII clients. The TAXII message typically contains a list of IP addresses (both IPv4 and IPv6) and domains. The member then communicates with the Grid Master and sends a request to create an RPZ rule on the specified RPZ based on the TAXII messages it receives. The RPZ rule created on NIOS is available in the Response Policy Zones tab, as shown in Figure 42.4.

Note: Once you start the TAXII server, the inbox for the configured collections is available at https://<member address>/services/inbox and the TAXII discovery service is available at https://<member address>/services/discovery, where <member address> is the MGMT or LAN IP address (IPv4 or IPv6 address of the port that is configured).

For more information about TAXII and STIX, refer to the following:

https://taxii.mitre.org/
Supported Appliances for TAXII Service

You can run the TAXII service on the following Infoblox appliance models: IB-1410, IB-1415, IB-1420, IB-1425, IB-VM-1410, IB-VM-1415, IB-VM-1420, IB-VM-1425, TE-810, TE-815, TE-2210, TE-2215, TE-2220, TE-2225, IB-VM-4010, IB-4030, IB-4030-10GE, IB-VM-2220, IB-VM-2225, PT-1400, PT-1405, PT-2200, PT-2205, PT-2205-10GE, PT-4000, and PT-4000-10GE.

Licensing Requirements and Permissions

To enable the TAXII service, you must install the **Security Ecosystem** license on any Grid member. You must also install an **RPZ** license on any Grid member in the Grid in order to create RPZ rules based on the TAXII messages. To allow a group to access the TAXII service, you can enable the group to authenticate with the TAXII server.

To enable a group to access the TAXII server:

1. From the **Administration** tab, select the **Administrators** tab -> **Groups** tab, and then click the Add icon.
2. In the **Add Admin Group wizard**, click the **Roles** tab and then complete the following in the **Allowed Interfaces** section:
   - **TAXII**: Select this check box to enable a group to authenticate with the TAXII server.
3. Save the configuration.

Mapping RPZs with TAXII Collections

NIOS supports arbitrary set of RPZ rules mapped to the corresponding TAXII collection. To map an RPZ with a TAXII collection:

1. From the **Grid** tab, select the **Grid Manager** tab -> **Services** tab.
2. In the **Services** tab, select the **TAXII_member** check box, and then click **Edit** -> **Member TAXII Properties** from the Toolbar.
3. In the **Member TAXII Properties** editor, complete the following:
   - **Response Policy Zone**: Click the Add icon and click **Select RPZ** to select an RPZ. When there are multiple zones, Grid Manager displays the **Zone Selector** dialog box from which you can select one.
   - **Collection**: Enter the name of the TAXII collection that will be mapped to the RPZ. Note that you can only use valid URI characters as collection names. You cannot use special characters or spaces.
   - **Add**: Click the Add icon to add the RPZ and collection name to the table.
   - **Save and Close**: Click this to save the configuration and close the editor.

You can do the following in this tab:

- To edit an entry in the list, click the check box beside an RPZ, and then click the Edit icon.
- To delete an entry in the list, select the check box beside an RPZ, and then click the Delete icon.

![Figure 42.3 Mapping RPZs with TAXII Collection](image)
Figure 42.4 RPZ Rules created for the Mapped RPZ and Collection

Starting and Stopping the TAXII Service

To start the TAXII service:
1. From the Grid tab, select the Services tab -> TAXII_member check box and then click the Start icon from the vertical Toolbar.

To stop the TAXII service:
1. From the Grid tab, select the Services tab -> TAXII_member check box and then click the Stop icon from the vertical Toolbar.

Extensible Attributes for TAXII Service

You can define extensible attributes that are specific to the TAXII service, as described in Extensible attributes for TAXII service. When you define TAXII specific extensible attributes, the RPZ rules created will have these attributes and their corresponding values (received in the TAXII messages) added automatically.

For information about how to configure extensible attributes, see About Extensible Attributes.

Table 42.3 Extensible attributes for TAXII service

<table>
<thead>
<tr>
<th>Attribute Name</th>
<th>Attribute Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>TAXII_collection</td>
<td>String</td>
<td>The name of the TAXII collection the TAXII client delivered the message to.</td>
</tr>
<tr>
<td>TAXII_source</td>
<td>String</td>
<td>The IP address of the TAXII client that sent the TAXII message.</td>
</tr>
<tr>
<td>TAXII_member</td>
<td>String</td>
<td>The TAXII Grid member that receives TAXII message resulting in the creation of the RPZ rule.</td>
</tr>
<tr>
<td>TAXII_timestamp</td>
<td>Date/Integer</td>
<td>The timestamp when the TAXII message was received.</td>
</tr>
<tr>
<td>TAXII_user</td>
<td>String</td>
<td>The login name of the user the TAXII client connected as to the TAXII server on the member that received the message.</td>
</tr>
</tbody>
</table>

Monitoring TAXII Server

You can monitor the status of the TAXII server, as described in Monitoring Grid Services. If there are any invalid TAXII messages, the appliance makes a syslog entry. For information, see Viewing RPZ in the Syslog. The appliance also sends an SNMP trap and an email notification, if configured. For information about setting SNMP and email notification, see Setting SNMP and Email Notifications.

Managing RPZs

You can manage RPZs that you defined earlier and modify their information. You can do the following:
Viewing RPZs

You can view the list of RPZs, local, feed, or FireEye integrated RPZs, which are currently listed in the Grid. To view RPZs:

1. From the Data Management tab -> DNS tab -> Response Policy Zones tab.
2. Grid Manager displays the following:
   - **Order**: Displays the order of RPZs. The order value is empty if you do not assign a primary name server when configuring a local RPZ, or if the local RPZ or the service is disabled.
   - **Name**: Displays the name of the RPZs. Click the RPZ link to view the following details:
     - **Name or Address**: Displays the domain name or the IP address.
     - **Policy**: Defines the policy defined for the corresponding domain name or IP address.
     - **Data**: Displays the target data of the rule.
     - **Comment**: Displays the comment specified when an RPZ is defined.
     - **Disabled**: Displays Yes if the RPZ rule is disabled.
     - **Site**: Displays extensible attributes that are associated with the domain name or IP address.
   - **Type**: Displays the type of RPZs, that is, **Local**, **Feed**, or **FireEye**.
   - **Primary Name Server**: Displays the primary name server that is associated with an RPZ.
   - **Last Updated**: Displays the last updated time. For RPZ feed, it indicates if the RPZ feed has stalled and when the last zone transfer happened. For a local and FireEye integrated RPZ, it indicates the last time the zone or data was modified.
   - **The last updated time is empty, if:**
     - A local RPZ is not associated with a primary Grid name server.
     - A zone, either a local RPZ or an RPZ feed, is not enabled.
     - An inbound zone transfer has not occurred for an RPZ feed.
     - Member's DNS service is disabled.
   - **Comment**: Displays the comment recorded when creating the zone. You can double-click on a row to edit the comment. Click Save after modification.
   - **Disabled**: Displays Yes if the RPZ is disabled. Otherwise, this field displays No.
   - **Locked**: Displays Yes when a zone is locked by an admin, and displays No when the zone is unlocked.
   - **Site**: Displays the values that were entered for this pre-defined attribute. You can double-click on a row to edit the Site. Click Save after modification.

You can also do the following:

- Use QuickFilter and the Goto function to narrow down the list. With the autocomplete feature, you can just enter the first few characters of an object name in the Goto field and select the object from the possible matches. Select a value from the drop-down list to filter the RPZs.
  - **None**: Select this to display all the RPZs that you have configured.
  - **All Local Response Policy Zones**: Select this to list only the local RPZs.
  - **All Feed Response Policy Zones**: Select this to list only the RPZ feeds.
  - **All FireEye Response Policy Zones**: Select this to list only the FireEye RPZs.
- Create a quick filter to save frequently used filter criteria. For information, see Using Quick Filters.
- You can create a bookmark for the RPZs. For information, see Using Bookmarks.
- You can modify some of the data in the table. Double-click a row of data, and either edit the data in the field or select an item from a drop-down list. Note that some fields are read-only. For more information about this feature, see Modifying Data in Tables.
- To export the list of RPZs to a .csv file, click the Export icon. For information on the export options, see About CSV Import.
- Click the Print icon to print the list of RPZs. For more information, see Printing from Grid Manager.

Modifying RPZs

You can modify the name servers or name server groups, update policy override details and permissions, or edit extensible attributes that are associated with an RPZ. Note that if you have configured a client IP address or network rule for a local RPZ, you cannot associate an Infoblox-4030 appliance as a Grid primary or a Grid secondary name server with that local RPZ.

To modify RPZs:

1. From the Data Management tab -> DNS tab -> Response Policy Zones tab -> Response Policy Zone check box and then click the Edit icon.

Copyright ©2019, Infoblox, Inc. All right reserved.
2. The RPZ editor provides the following tabs from which you can modify data:
   - In the **General** tab, you can change the information you previously entered through the wizard, as described in Configuring Local RPZs. For FireEye integrated RPZs, you can update the policy type, comments, enable or disable, or lock the zone. For more information, see Configuring FireEye RPZs.
   - For a FireEye integrated RPZ, the **FireEye** tab is displayed. This tab is displayed only after you install the FireEye license. You can modify or override the rule mapping for FireEye alerts or APT events. For more information, see Configuring FireEye RPZs.
   - You can also enter or edit information in the **Name Servers**, Extensible Attributes, **Settings** and **Permissions** tabs. For information on modifying and deleting resource records, see Modifying, Disabling, and Deleting Host and Resource Records.

3. Save the configuration and click **Restart** if it appears at the top of the screen.

Reordering RPZs

You can change the order of RPZs, local feeds, or FireEye integrated RPZs, in each view. When you add a new local RPZ, it is added to the top of the zone list and an RPZ feed is automatically added to the bottom of the zone list. You can change the order of each through the re-ordering process.

The policy override works based on zone ordering. The zone at top has the highest priority and it overrides the lower priority zone. To override an RPZ feed with a local RPZ, place the local feed at the top before an RPZ feed. You cannot reorder zones, if they are disabled or do not have any primary name server assigned.

To reorder RPZs:

1. From the **Data Management** tab, select the **DNS tab** -> **Response Policy Zones** tab, click **Order Response Policy Zones** from the **Toobar**.
2. The following are displayed in the **Order Response Policy Zones** wizard:
   - **Ordering**: Use the up and down arrows to move the RPZ to the desired order.
   - **Response Policy Zone**: Displays all the RPZs.
   - **Priority**: Displays the order of RPZs.
3. Click **OK** to save the changes.

Locking and Unlocking RPZs

You can lock an RPZ so you can make changes to it and prevent others from making conflicting changes. When you lock an RPZ, Grid Manager displays LOCKED beside the RPZ. When other administrators try to make changes to a locked RPZ, the system displays a warning message that the RPZ is locked and the name of the admin who locked the RPZ.

Only a superuser or the administrator who locked the RPZ can unlock it. RPZ locks do not expire; you must manually unlock a locked RPZ. To lock or unlock RPZs:

1. From the **Data Management** tab, select the **DNS tab** -> **Response Policy Zones** tab, select the **Response Policy Zone** -> **Ruleset**.
2. You can do the following:
   - **To Lock**: Click the **Lock** icon to lock the zone.
   - **To Unlock**: Click the **Unlock** icon to unlock the zone.

Deleting RPZs

You can delete RPZs or schedule them for deletion for a later date. The NIOS appliance moves the deleted RPZs to the Recycle Bin, if enabled. When you restore the zone from the Recycle Bin, it will be restored to the bottom of the zone list.

To delete RPZs:

1. From the **Data Management** tab, select the **DNS tab** -> **Response Policy Zones** tab, select **Response Policy Zone** -> **Ruleset**.
2. To delete an RPZ immediately, click the **Delete** icon, and then click **Yes** to confirm the delete request. To schedule the deletion, click **Schedule Deletion** and in the **Schedule Change** panel, enter a date, time, and time zone. For information, see **Scheduling Deletions**.

Grid Manager moves the RPZ to the Recycle Bin, from which you can restore or permanently delete it.

Managing RPZ Rules

You can manage local RPZ, including FireEye integrated RPZ rules that you defined earlier and modify their information. You can do the following:

- View RPZ rules, as described in **Viewing RPZ Rules**.
- Modify RPZ rules, as described in **Modifying RPZ Rules**.

**Note:** You cannot modify the rules of an RPZ feed. However, you can override the entire ruleset or each rule using local RPZs.

- Delete RPZ rules, as described in **Deleting RPZ Rules**.
- Copy RPZ rules, as described in **Copying RPZ Rules**.
- Import RPZ rules, as described in **Importing RPZ Rules**.
- Disable NSDNAME and NSIP rules for RPZ zones, as described in **Disabling NSDNAME and NSIP rules for RPZ zones**.
Viewing RPZ Rules

You can view and edit the rules that are defined for each local RPZ, including FireEye integrated RPZs. To view RPZ rules:

1. From the Data Management tab -> DNS tab -> Response Policy Zones tab -> click the RPZ link.
2. You can view the following:
   - **Name or Address**: Displays the domain name or the IP address on which the rule is defined.
   - **Policy**: Displays the rule applied on the domain name or the IP address.
   - **Data**: Displays the target data of the rule.
   - **Comment**: Displays the comment specified when the rule is defined.
   - **Disabled**: Displays Yes if the RPZ rule is disabled. Otherwise, this field displays No.
   - **Site**: Displays an extensible attribute, Site.
   - **Expiration**: Displays the expiration time for the corresponding FireEye integrated RPZ rule. Note that NIOS updates the expiration time when you change the lifetime of the FireEye integrated RPZ rule, or if the last updated time of the rule changes, or if the alert type that generates the rule changes. This time is estimated based on the following:
     
     \[
     \text{Expiration Time} = \text{Lifetime of an alert type} + \text{Last updated time of the rule}
     \]
     
     NIOS runs a scheduler every 10 minutes to identify FireEye integrated RPZ rules whose expiration time is less than the current time. If there are rules whose expiration time is less than the current time, then such rules will be deleted. NIOS logs all deletion activities in the syslog. You can view the syslog to verify expired rules. For more information, see Viewing RPZ in the Syslog.
   - **FireEye Alert Type**: Displays the type of FireEye alert.
   - **Last Updated**: Displays the time when the RPZ rule was last updated.

**Note**: The columns, **Expiration**, **FireEye Alert Type**, and **Last Updated**, are displayed only for FireEye integrated RPZ rules. These columns are not displayed for non-FireEye RPZ rules.

You can also do the following:

- Use **Quick Filter** and the Go to function to narrow down the list. With the autocomplete feature, you can just enter the first few characters of an object name in the Go to field and select the object from the possible matches.
- Create a quick filter to save frequently used filter criteria. For information, see Using Quick Filters.
- Modify some of the data in the table. Double click a row of data, and either edit the data in the field or select an item from a drop-down list. You can edit **Comments** and **Extensible Attributes**. Note that some fields are read-only. For more information about this feature, see Modifying Data in Tables.
- To export the list of RPZ rules to a .csv file, click the Export icon. For information on the export options, see About CSV Import.
- Click the Print icon to print the list of RPZ rules. For more information, see Printing from Grid Manager.

Modifying RPZ Rules

You can modify the name of a local or FireEye integrated RPZ rule, IP address, network address, substituted name, and the comment recorded for the corresponding rule. You can also update the TTL settings or the extensible attributes that are associated with an RPZ rule.

To modify RPZ rules:

1. From the Data Management tab -> DNS tab -> Response Policy Zones tab -> click the RPZ link -> Name or Address check box, and then click the Edit icon.
2. The RPZ rules editor provides the following tabs from which you can modify data:
   - In the **General** tab, you can change the information you previously entered through the wizard. For more information, see Configuring Rules for RPZs.
   - You can also enter or edit information in the **TTL and Extensible Attributes** tabs. For information about TTL settings, see About Time To Live Settings. For information about extensible attributes, see About Extensible Attributes.
3. Save the configuration.

Deleting RPZ Rules

You can delete local RPZ rules, including FireEye integrated RPZ rules, or schedule them for deletion for a later date. When you remove an RPZ rule, the NIOS appliance moves it to the Recycle Bin, if enabled.

To delete RPZ rules:

1. From the Data Management tab, select the DNS tab -> Response Policy Zones tab -> Response Policy Zone -> Ruleset.
2. To delete an RPZ rule immediately, click the Delete icon, and then click Yes to confirm the delete request. To schedule the deletion, click **Schedule Deletion** and in the Schedule Change panel, enter a date, time, and time zone. For information, see Scheduling Deletions.

Grid Manager moves the RPZ rule to the Recycle Bin, from which you can restore or permanently delete it.
Copying RPZ Rules

You can copy rules from one local RPZ to another local RPZ or from one FireEye integrated RPZ to another FireEye RPZ. You can also copy rules from a local RPZ to a FireEye integrated RPZ or vice-versa. Different views of the same RPZ may have a number of rules in common. If this is the case, you can copy rules between views and zones.

To copy RPZs between DNS zones and views:

1. From the Data Management tab, select the DNS tab -> Response Policy Zones tab, click Copy Rules from the Toolbar.
2. In the Copy Rules dialog box, Grid Manager displays the last selected zone or the zone from which you are copying rules in the Source field. The following fields are displayed:
   - Source: Grid Manager displays the last selected zone or the zone from which you are copying rules. It also displays the associated DNS view.
   - Destination: Click Select Zone to select the destination zone. When there are multiple zones, Grid Manager displays the Zone Selector dialog box from which you can select one. After you select the zone, Grid Manager displays the associated DNS view.
   - Copy All Rules: Select this option to copy all the rules.
   - Copy Specific Rules: Select this option to copy specific rules only. Select a rule from the Available column and click the right arrow to move it to the Selected column.
   - Copy Options: Select one of the following:
     - Delete all rules in the destination before copying the rules: Select to delete all rules in the destination zone before the records are copied.
     - Overwrite existing rules: Select to overwrite existing rules that have the same domain name owners as the rules being copied.
3. Click Copy & Close.

Importing RPZ Rules

You can import rules from an RPZ zone to a local zone. To import, you must enable zone transfer on the external server. The rules of the existing zone are overwritten when you import rules from an external server.

To import RPZ rules:

1. From the Data Management tab, select the DNS tab -> Response Policy Zones tab -> click the RPZ link in the Name column -> Rules, click Import Zone from the Toolbar.
2. In the Import Zone dialog box, the following fields are displayed:
   - Zone: The RPZ that you have selected is displayed.
   - DNS View: The DNS view that you have selected is displayed.
   - Address: Enter the address of the external server from where you want to import rules.
3. Click Import.

Disabling NSDNAME and NSIP rules for RPZ zones

NSDNAME and NSIP rules are enabled for RPZ zones by default. You can disable or enable NSDNAME and NSIP rules to control the validation of NS records and glue records received by upstream DNS servers. When you enable RPZ on internal DNS servers and if there are forward-mapping zones that are not reachable from external networks, NSDNAME and NSIP validation is not necessary. In this case, you can disable NSDNAME and NSIP rules to reduce delays in responses. When you disable these rules for RPZ zones, the appliance bypasses NSDNAME and NSIP validation for the queries and it significantly improves the performance. Note that this setting disables both NSDNAME and NSIP rules at the same time for both internal and external RPZ zones. This setting only affects the lookup process but the zone data remains unchanged. NSDNAME and NSIP records will still be available in RPZ zones during zone transfers (AXFR and IXFR). If you disable NSDNAME and NSIP rules for RPZ zones at the Grid level, all members inherit this setting. You can override this setting for each member.

Note: Disabling NSDNAME and NSIP rules for RPZ zones on members which may send recursive queries to external servers, results in reduced security. Accordingly, it is not recommended to disable these rules for RPZ zones on members that respond with data from external servers.

To disable NSDNAME and NSIP rules for RPZ zones:

1. Grid: From the Data Management tab, select the DNS tab, expand the Toolbar and click Grid DNS Properties. Member: From the Data Management tab, select the DNS tab, click the Members tab -> member check box -> Edit icon.
2. In the Grid DNS Properties or Member DNS Properties editor, click the General tab -> Advanced tab and complete the following:
   - Disable NSDNAME and NSIP rules for RPZ zones: This check box is deselected and NSDNAME and NSIP rules are enabled for RPZ zones by default. Select this check box to disable NSDNAME and NSIP rules for all RPZ zones. To override the value inherited from the Grid, click Override. To retain the same value as the Grid, click Inherit.
3. Save the configuration and click Restart if it appears at the top of the screen.

Configuring Prefix Length Limit for RPZ-IP Triggers
To avoid the possibility of DNS outage resulting from errors in the RPZ rules received from external sources by the RPZ feed or due to errors in the RPZ rules added to local RPZ, Infoblox provides an option to set the prefix length limit for RPZ-IP triggers. This enables the appliance to ignore RPZ-IP rules with prefix lengths that are less than the configured minimum prefix length, and to enforce only those RPZ-IP rules whose prefix lengths are equal to or greater than the configured minimum prefix length, thus accepting legitimate queries instead of dropping all queries. For example, if you configure 24 as the minimum IPv4 prefix length, the Grid enforces only those RPZ-IP rules with prefix length equal to or greater than 24 and the RPZ-IP rules with prefix lengths less than 24 are not enforced on queries that originate from external sources. You can configure the prefix length limit for IPv4 and IPv6 prefixes at the Grid level and override it for a member, DNS view, or RPZ zone. The appliance logs a warning message in the syslog when RPZ-IP rules with prefix length less than the configured minimum prefix length are added to the local RPZ and, when an RPZ feed receives RPZ-IP rules with prefix length less than the configured prefix length from external sources.

To configure the prefix length limit for RPZ-IP triggers:

1. Grid: From the Data Management tab, select the DNS tab, and then select Grid DNS Properties from the Toolbar.
   Member: From the Data Management tab, select the DNS tab -> Members tab -> member check box -> Edit icon.
   DNS View: From the Data Management tab, select the DNS tab and click the Zones tab -> dns_view check box -> Edit icon.
   RPZ Zone: From the Data Management tab, select the DNS tab -> Response Policy Zones tab -> Response policy zone check box -> Edit icon.
2. In the editor, click Toggle Advanced Mode, and then select the Security tab.
3. Complete the following in the Response Policy Zones section of the Security tab:
   - Ignore RPZ-IP triggers with too small prefix lengths: Select this check box to set the prefix length limit for RPZ-IP triggers and enable the appliance to ignore the RPZ-IP rules with prefix lengths that are less than the specified prefix length limit. This check box is deselected by default.
     - Minimum IPv4 Prefix Length: Enter the minimum prefix length for IPv4 prefixes. You can specify a value between 1 to 31. The default value is 29.
     - Minimum IPv6 Prefix Length: Enter the minimum prefix length for IPv6 prefixes. You can specify a value between 1 to 127. The default value is 112.
4. Save the configuration and click Restart if it appears at the top of the screen.

Configuring Thresholds for RPZ Hit Rate

When the RPZ hit rate, which is the ratio of the number of queries that result in modifying the genuine response due to RPZ rules to the total number of incoming queries is high, it is unexpected and might warrant your attention. Note that the queries that hit passthru RPZ rules are not considered for the RPZ hit rate. You can configure thresholds for RPZ hit rate, above which the appliance makes a syslog entry and sends alerts as SNMP traps and email notifications. Note that you must enable notifications in order for the appliance to send SNMP traps and email notifications. For information about setting the SNMP trap and email notifications, see Setting SNMP and Email Notifications.

Note that the appliance calculates the RPZ hit rate globally for all DNS views and sometimes the RPZ hit rate might be misleading. For example, if there are multiple DNS views with or without RPZ rules, there is a possibility that some DNS views might receive a substantial number of normal queries, obscuring the possible high RPZ hit rate in the other DNS views. Also, when the DNS server is configured for both authoritative and recursive queries, it is possible that the authoritative zones receive a substantial number of queries for which RPZ rules are not considered. It might make the resulting RPZ hit rate normal even if there is an excessive number of hit for recursive queries.

To configure the thresholds for RPZ hit rate:

1. Grid: From the Grid tab, select the Grid Manager tab, and then select Grid Properties -> Edit from the Toolbar. Member: From the Grid tab, select the Grid Manager -> Members tab -> member, and then click the Edit icon.
2. In the Grid Properties or Grid Member Properties editor, click Toggle Advanced Mode, and then select the SNMP Threshold tab.
3. Complete the following in the Response Policy Zones Hit Rate Configuration section of the SNMP Threshold tab.
   - RPZ Hit Rate: Click Override to override the inherited settings, and specify the following:
     - Trigger %: Enter the Trigger value between 0 and 100. If the RPZ hit rate equals the Trigger value, the appliance logs a syslog entry and — if configured to do so — sends an SNMP trap and an email notification. The default Trigger value is 10%.
     - Reset %: Enter the Reset value between 0 and 100. If the RPZ hit rate equals the Reset value, the appliance logs a syslog entry and — if configured to do so — sends an SNMP trap and an email notification, to notify that the RPZ hit rate has gone back to an acceptable level. The default Reset value is 2%.
     - Interval: Enter the time interval that determines when the appliance starts calculating the RPZ hit rate. You can enter a value between 1 and 86400. The default value is 10 seconds. At the end of each interval, if the number of incoming queries equals or exceeds the Minimum query value, the appliance calculates the RPZ hit rate and if the RPZ hit rate exceeds the Trigger value, the appliance sends notifications and continues to send notifications at the end of subsequent intervals, until the RPZ hit rate equals the Reset value. Note that the appliance calculates the RPZ hit rate at the end of each Interval or when the number of incoming queries reach the Maximum query value, whichever comes sooner.
     - Minimum query: Specify the minimum number of queries received between the RPZ hit rate checks. The default value is 1000. The appliance calculates the RPZ hit rate when the number of incoming queries equals or exceeds the Minimum query value at the end of the Interval. If the total number of incoming queries is less than the Minimum query value, the appliance skips the RPZ hit rate check and the query count continues to cumulate into subsequent intervals until the Minimum query is met.
     - Maximum query: Specify the maximum number of queries received between the RPZ hit rate checks. The default value is 100000. When the number of incoming queries equals or exceeds this value, the appliance calculates the RPZ hit rate and does not wait for the expiration of the Interval.
4. Save the configuration and click **Restart** if it appears at the top of the screen.

**Verifying RPZ Configuration**

After you have set up and configured RPZs and RPZ rules, you can verify whether the RPZ zone transfers are functioning properly by doing the following:

- View the RPZ syslog messages, as described in [Viewing RPZ in the Syslog](#).
- Verify the last RPZ updates, as described in [Viewing the Last Updated RPZs](#).

The appliance also makes a syslog entry, when an RPZ zone refresh succeeds or fails and also sends an SNMP trap and an email notification, if configured. For information about setting SNMP and email notification, see [Setting SNMP and Email Notifications](#).

**Viewing RPZ in the Syslog**

To receive RPZ information in the syslog, make sure that you enable the RPZ option in the Logging tab of the Grid DNS Properties editor. For information about configuring logging properties, see [Setting DNS Logging Categories](#). Once the RPZ option is enabled, the appliance logs RPZ threats in CEF (Common Event Format) in the syslog. You can click the Action icon to view the RPZ threat details in the RPZ Threat Details viewer. For information about how to configure the syslog server, see [Using a Syslog Server](#).

Following is a sample RPZ threat message:

```
2014-09-15T07:14:47-07:00 daemon info rpz:
CEF:0|Infoblox|NIOS|6.12.0-252689|RPZ-QNAME |PASSTHRU|7|app=DNS dst=172.31.1.156
src=10.120.20.69 spt=39503 view_default qtype=A msg="rpz QNAME PASSTHRU rewrite
passthru.com [ANY] via passthru.com.rpz_1.com
```

Each log message contains the following information:

- The timestamp when the event happened in `yyyy-mm-ddThh:mm:ss-00:00` format.
- `Infoblox|NIOS` indicates the Infoblox product, and `x.x.x` represents the NIOS version.
- The string following the NIOS version is a hard-coded constant. In this example, it is `RPZ-QNAME`.
- The hard-coded constant is followed by mitigation action. In this example, it is `PASSTHRU`.
- The number following the mitigation action is the threat severity level. The following numbers indicate the severity levels:
  - 8 = Critical
  - 7 = Major
  - 6 = Warning
  - 4 = Informational
- `dst`: Destination IP address.
- `src`: Source IP address.
- `spt`: Source port.
- `view`: DNS view.
- `qtype`: Query type.
- `msg`: RPZ rule.

The syslog messages are optionally tagged according to the logging category configured in the external syslog servers. For more information, see [Syslog Message Prefixes](#).

To verify RPZ zone transfers:

1. Go to the **Administration** tab -> **Logs** tab -> **Syslog** tab.
2. Select **RPZ Incident Logs** from the **Quick Filter** drop-down list.
3. Review the syslog for zone transfer confirmation, as shown in **Figure 42.5**.

*Figure 42.5 The Syslog Viewer*
### Viewing the Last Updated RPZs

To view the last updated RPZs:

1. Go to the **Data Management** tab -> **DNS** tab -> **Response Policy Zones** tab.
2. Review the **Last Updated** column and confirm the time when an RPZ was last updated, as shown in **Figure 42.6**.

**Note:** It may take up to 10 minutes before the updated information is displayed.

### Chapter 44 Cisco ISE Integration

This chapter describes how to integrate Cisco ISE (Identity Services Engine) into the NIOS appliance to enhance identity management across devices and applications that are connected to your network routers and switches. It provides guidelines about how to subscribe and publish contextual data, and add notification rules. By integrating Cisco ISE, you can gain greater visibility in user and device information, thereby enhances security across your network resources. It includes the following sections:

- Integrating Cisco ISE into NIOS
- NIOS Licensing Requirements
- Administrative Permissions
- Prerequisites
- Generating Certificates
Integrating Cisco ISE into NIOS

With the rapid growth of BYOD (Bring Your Own Device) trend, the complexity of securing network resources has become more challenging. To ensure data privacy and security of all network resources against threats, Infoblox introduces the **Ecosystem** feature that allows you to expand the visibility of networks, users, and devices. Using this feature improves overall IT operations by sharing information between network and security teams.

Integrating Cisco ISE server into NIOS enables NIOS and Cisco ISE to exchange valuable network, user, device, and security-event information, enriching both Infoblox DDI and Cisco ISE data. Cisco ISE is a centralized security solution (Network Access Control) that automates and enforces context-aware security access to network resources. NIOS supports the integration of Cisco ISE versions 1.3, 1.4, and 2.0. This feature ensures that only the authorized users from legitimate devices get access to the services they need.

**Note:** Cisco ISE does not support IPv6 addresses.

When you configure a Cisco ISE, you can do the following:

- **Subscribe to contextual data:** NIOS acts as a client to the Cisco ISE and collects information about the subscribed data types. You can configure extensible attributes without restricting them to specific object types, and then map these extensible attributes to Cisco ISE data to collect additional information. You can view subscribed information collected from the Cisco ISE in the appropriate tabs (IPAM, IP Map panel, and Network Users) of the Infoblox GUI. For information about how to subscribe to contextual data, see **Configuring Cisco ISE on NIOS**. You can also monitor subscription data using the **Subscription** report. For information, see **Subscription Data**.

- **Publish contextual data** - You can publish contextual data from NIOS to specific Cisco ISE based on the conditions and criteria specified in the notification rules. To publish RPZ and threat protection notifications, you must first set up an external syslog server, as described in **Specifying Syslog Server for Notifications**. For information about notification rules, see **Configuring Notification Rules**. You can monitor published data using the **Publish Data** report through the Reporting and Analytics feature. For information about this report, see **Publish Data**.

NIOS Licensing Requirements

You must install the **Network Insight** license to configure Cisco ISE. You might need the following licenses to configure notification rules for RPZ and threat protection event types:

**Table 44.1 Required Licenses**

<table>
<thead>
<tr>
<th>License</th>
<th>Event Types</th>
</tr>
</thead>
<tbody>
<tr>
<td>RPZ</td>
<td>DNS RPZ</td>
</tr>
<tr>
<td>Threat Protection</td>
<td>Security ADP</td>
</tr>
<tr>
<td>DNS, DHCP, and MSGMGT</td>
<td>IPAM</td>
</tr>
<tr>
<td>DNS and DHCP</td>
<td>DHCP Lease</td>
</tr>
</tbody>
</table>

For information about how to install licenses, see **Managing Licenses**.

Administrative Permissions

By default, only superusers can add, edit, and delete Cisco ISEs. Limited-access admin groups can access Cisco ISEs only if their administrative permissions are defined. For information about administrative permissions, see **About Administrative Permissions**.

Prerequisites

Do the following before you begin using this feature on NIOS:

- Cisco ISE uses SSL certificates as the method of authentication. You must upload the client certificate and client key when configuring the Cisco ISE server. You can include both client certificate and key in a single file and then upload. For information, see **Generating Certificates**.
Note: Make sure to use the host name of the Grid member that is selected as the subscribing member. The host name of the subscribing member must match with the Common Name that you mention while generating the certificate.

- For the bulk download certificate, download the server certificate from the monitoring node. If the admin node and monitoring node are on one node, then download the certificate from the admin node. Log into Cisco ISE and download the default self-signed server certificate (Administration -> System -> Certificates -> Export).
- For the CA certificate, download the CA certificate from the admin node or the self-signed certificate (Administration -> System -> Certificates -> Export).
- Register NIOS as a client on the Cisco ISE. You must enable the Auto-Registration option on the Cisco ISE: From the Administration menu -> click pxGrid Services, and then click Enable Auto-Registration. For more information, refer to Cisco ISE documentation. When you register NIOS successfully, you can view infoblox_client_subscribe_xxxx and infoblox_client_publish_xxxx, where xxxx is a number generated based on the IP of the subscribing member on the Cisco ISE. If auto-registration is not enabled, approve the pxGrid client after registration. If you change the certificates, Cisco ISE may not register the client successfully. In this case, delete the related pxGrid client from the Cisco ISE server, which is automatically created again.
- Enable the Identity Mapping feature on the NIOS appliance:
  a. From the Grid tab, select the Grid Manager tab -> Grid Properties -> Edit from the Toolbar.
  b. In the Grid Properties Editor, select the General tab -> Advanced tab, select the Enable network users feature check box.
- To publish data:
  - To publish dynamic data, such as DHCP lease and IPAM information, make sure that you approve Infoblox_DHCP and Infoblox_IPAM on the Cisco ISE, and then configure notification rules as described in Configuring Notification Rules.
  - To publish RPZ and threat protection notifications to the Cisco ISE server, you must first set up an external syslog server and then configure notification rules, as follows:
    a. Configure an external syslog server that listens on port 2000, as described in Specifying Syslog Server for Notifications.
    b. Set up notification rules, as described in Configuring Notification Rules.

Note: Refer to Cisco ISE documentation for information about how to perform auto-registration, creating authorized groups, and approving dynamic topics.

Generating Certificates

To generate a self-signed key and certificate:

1. openssl genrsa -out self1.key 4096
2. openssl req -new -key self1.key -out self1.csr
3. openssl req -x509 -days 365 -key self1.key -in self1.csr -out self1.cer

For CSR request:

Country Name (2 letter code) [XX]: <Country Name>, for example: US
State or Province Name (full name) []: <State Name>, for example: CA
Locality Name (eg, city) [Default City]: <City Name>, for example: SC
Organization Name (eg, company) [Default Company Ltd]: <Company Name>, for example Infoblox
Organizational Unit Name (eg, section) []: <Organization Name>, for example: QA
Common Name (eg, your name or your server's hostname) []: <host name of the subscribing member>
Email Address []:

Enter the following 'extra' attributes to be sent with your certificate request:

A challenge password []:

Import the certificate generated in step 3 to Cisco ISE's trusted store. Select the Trust for authentication within ISE check box.

Export the self-signed ISE certificate of the ISE server (under System -> Certificates). Make sure to select the pxGrid: Use certificate for the pxGrid Controller check box before exporting it.

You can call this as isemnt.cert

Wait for ISE services to restart. It may take a few minutes.

Configuring Cisco ISE on NIOS
You can configure Cisco ISE servers 1.3, 1.4 and 2.0 on the NIOS appliance. You can subscribe for identity information that you wish to collect from the Cisco ISE, such as user name, domain name, VLAN, session state, SSID, endpoint profile, and security group. You can also add extensible attributes without restricting it to specific object types, and map these extensible attributes with the Cisco ISE field types to collect additional information. Note that you can subscribe to only one Cisco ISE per member and each member can subscribe to only one Cisco ISE. You can publish ADP and RPZ notifications, DHCP and IPAM information from NIOS to Cisco ISEs based on the notification rules that you have configured. Note that you can publish DHCP lease and IPAM information only to Cisco ISE 2.0. You can view the subscribed information from the IPAM tab and the IP Map panel. Make sure that you synchronize time between the managing member and Cisco ISE.

**Configuring Cisco ISE Servers**

To configure a Cisco ISE server:

1. From the **Grid** tab, select the **Ecosystem** tab, and then click the **Add Cisco ISE** from the Toolbar.
   - From the **Grid** tab, select the **Ecosystem** tab, and then click the **Add Cisco ISE** from the Toolbar.
2. In the **Add Cisco ISE** wizard, complete the following.
   - **Server Address:** Enter the IP address of the Cisco ISE.
   - **Version:** Select the version of the Cisco ISE.
   - **Subscribing Member:** Click Select to select a Grid member that you want to subscribe as the client on the Cisco ISE. In the **Member Selector** dialog box, select a Grid member from the list. This member interacts with the Cisco ISE to obtain contextual information for the subscribed data types.
   - **Network View:** This appears only when you have multiple network views. From the drop-down list, select the network view in which you want to create the network.
   - **Client Certificate:** Click Select to upload the client certificate. In the **Upload** dialog box, click Select to navigate to the certificate, and then click **Upload**.
   - **Bulk Download Certificate:** Click Select to download the server certificate from the monitoring node or self-signed certificate.
   - **Manage Certificates:** Click **CA Certificates** to upload the self-signed certificate or CA certificate. In the **CA Certificates** dialog box, click the **Add** icon, and then navigate to the certificate to upload it.
   - **Test Credentials:** Click this to validate the Cisco ISE configuration before proceeding. When you click Test Credentials, the appliance validates the certificates.
   - **Comment:** Enter additional information about the configuration.
   - **Disabled:** Select this if you want to save the configuration but do not want to use it yet. You can clear this check box when you are ready to use this Cisco ISE.

3. Click **Next** to specify the data types that you are interested to obtain from the Cisco ISE. The Cisco ISE shares information only for the subscribed data types. Complete the following to specify data types you want to collect from the Cisco ISE:
   - **Subscription Settings:** There are predefined data types in the **Available Data Type** table you can subscribe. Use the arrows to move data types from the **Available Data Type** table to the **Selected Data Type** table and vice versa. The appliance receives information for all data types in the **Selected Data Type** table.
   - **Map other data types to Extensible Attributes:** You can create extensible attributes and map these extensible attributes to receive additional Cisco ISE data values, such as IP address, MAC, NAS IP Address, NAS Port ID, EPS Status, Posture Status, Posture Timestamp, Endpoint Profile Name, Account Session ID, and Audit Session ID. Click the **Add** icon and map a Cisco ISE data type to an extensible attribute. You can also select a row and click the **Delete** icon to delete it.

4. Click **Next** to add extensible attributes to the Cisco ISE. For information, see **About Extensible Attributes**.

5. Save the configuration.

**Modifying Cisco ISE Configurations**

You can select data types that need to be published from NIOS to Cisco ISE after you have configured the Cisco ISE. You can modify the Cisco ISE configurations, as follows:

1. From the **Grid** tab, select the **Ecosystem** tab, and then click the **Add Cisco ISE** from the Toolbar.
2. The Cisco ISE Server editor provides the following tabs from which you can modify data:
   - **General:** You can modify data in this tab as described in **Configuring Cisco ISE on NIOS**.
   - **Subscription:** You can edit data types that you have subscribed. You can use the arrows to move data types from the **Available Data Type** table to the **Selected Data Type** table and vice versa. The appliance receives information for all data types in the **Selected Data Type** table and extensible attributes that are configured.
   - **Publication:** To publish dynamic data from NIOS, you must first configure notification rules, as described in **Configuring Notification Rules**. You can add data types that you want to publish to Cisco ISE server by using the arrows to move data types from the **Available** table to the **Selected** table and vice versa. The appliance publishes information only for the data types that are added in the **Selected** table.
   - **Extensible Attributes:** You can add, modify, and delete extensible attributes that are associated with the Cisco ISE server. For information, see **About Extensible Attributes**.
3. Save the changes.
Overriding Subscription Settings

You can override subscription settings and mapped extensible attributes at the network container, network, and DHCP range levels. By default, networks inherit subscription settings from those configured while adding the Cisco server. You can override these settings and subscribe new values at the DHCP range, network container, or network level. A network inherits subscription settings from its parent object. If you override the values at the network container level, then the network inherits the network container values. Otherwise, the network continues to inherit the values configured from the Cisco ISE. A shared network without a parent network container continues to inherit settings from the Cisco ISE.

To override an inherited value, click Override next to it and complete the appropriate fields. When you click Override, the appliance displays the value inherited from its parent object (if any).

To override subscription settings and mapped extensible attributes:

1. **Network Level**: From the Data Management tab, select the DHCP tab -> Networks tab -> Networks -> network check box, and then click the Edit icon.
2. **Network Container**: From the Data Management tab, select the IPAM tab -> network_container check box, and then click the Edit icon.
3. **DHCP Range Level**: From the Data Management tab, select the DHCP tab -> Networks tab -> Networks -> network -> addr_range check box, and then click the Edit icon.

Viewing Identity Mapping Information

To view user information, you must first enable identity mapping feature at the Grid level. For information about enabling Identity Mapping feature, see [Enabling Identity Mapping](#).  

**Note:** You do not need an MS Management license to enable the identity mapping feature.

You can view user information in the Network Users tab. For more information, see [Viewing Identity Mapping Information](#).

Deleting Cisco ISE Servers

When you delete a Cisco ISE, the appliance moves it to the Recycle Bin, if enabled. You can later restore it if needed. To delete a Cisco ISE server:

1. From the Grid tab, select the Ecosystem tab > Cisco tab -> Cisco ISE server check box, and then click the Delete icon.
2. In the Delete Confirmation dialog box, click Yes to delete the Cisco ISE server.

Publishing Data

To publish dynamic data, such as DHCP lease and IPAM information, make sure that you approve Infoblox_DHCP and Infoblox_IPAM on the Cisco ISE, and then configure notification rules as described in [Configuring Notification Rules](#).

To publish RPZ and threat protection notifications to the Cisco ISE server, you must first set up an external syslog server and then configure notification rules, as follows:

1. Configure an external syslog server that listens on port 2000, as described in [Specifying Syslog Server for Notifications](#).
2. Set up notification rules, as described in [Configuring Notification Rules](#).

Specifying Syslog Server for Notifications

Before you can publish RPZ and threat protection notifications to the Cisco ISE, you must first configure the syslog server to which the appliance logs RPZ and threat protection events. The appliance generate notifications about these events and analyze the data before sending it to the Cisco ISE. When setting up the syslog server, ensure that you select DNS RPZ and Threat Protection logging categories so all events related to RPZ and threat protection hits are logged to the syslog.

**Note:** For Cisco ISE to take appropriate action to quarantine malicious IP addresses, ensure that the EPSStatus (Endpoint Protection Status) in the Authorization Policy is set to "Quarantine." This is set by default.

To specify an external syslog server in NIOS, complete the following:

1. From the Grid tab, select the Grid Manager tab -> Members tab, and then click Grid Properties -> Edit from the Toolbar.
2. In the Grid Properties editor, select the Monitoring tab, and then follow the procedures described in [Specifying Syslog Servers](#) using the following settings:
   - Address: Enter the loopback address 127.0.0.1 so the appliance sends notifications to itself.
   - Transport: Select UDP.
   - Interface: Select LAN. The appliance uses the LAN1 port to send syslog messages.
   - Source: Select Any. The appliance sends both internal and external syslog messages.
2. Port: Enter 2000 as the port number.
3. Logging Category: Select DNS RPZ and Threat Protection.

Save the configuration.

Configuring Notification Rules

You can configure notification rules after you have configured Cisco ISE on the NIOS appliance. For information, see Configuring Cisco ISE on Ni OS. To publish data and notifications from NIOS to Cisco ISE, you must configure notification rules. You can create notification rules for the following event types: DNS RPZ, Security ADP, IPAM, and DHCP Lease. Note that the DNS RPZ and Security ADP event types are available only if you have installed RPZ and Threat Protection licenses in the Grid. Each notification rule specifies the target Cisco ISE, the Grid member on which you wish to run this rule, notification rule criteria, and the action to be taken for the matching events. NIOS publishes information, such as DHCP lease information, IPAM data, and quarantine events, when the triggered events matches the notification rule criteria. Note that the DHCP Lease and IPAM event types are available only for the Cisco ISE 2.0 target servers.

Note: Quarantine events are published to the Cisco ISE whenever the first rule matches the trigger criteria and it ignores all other rules.

To add notification rules:

1. From the Grid tab, select the Ecosystem tab -> Notification tab, and then click the Add icon.
   Or
   From the Grid tab, select the Ecosystem tab, and click Add Notification Rule from the Toolbar.

2. In the Add Notification wizard, complete the following:
   - Name: Enter the name of the rule.
   - Target: Select the IP address of the target server on which you want to publish from NIOS. This field displays all the IP addresses of the Cisco servers you have added.
   - Comment: Enter useful information about the notification rule.
   - Disable: Select this option to disable the notification rule.

3. Click Next and complete the following:
   - Event: The appliance displays the list of event types based on the licenses installed. The values in the drop-down list are:
     - DNS RPZ: Select this to create notification rules for the DNS RPZ events.
     - Security ADP: Select this to create notification rules for Security ADP threat events.
     - IPAM Type: Select this to send IPAM data. No notification rule is required for this event type.
     - DHCP Leases: Select this to create notification rules for DHCP Lease events. This is available for Cisco ISE 2.0.
   - In the Match the following rule section, select filters, operators and values from the drop-down lists for the selected event type. You can use the + icon to construct nested expressions within an event category.

<table>
<thead>
<tr>
<th>Event Type</th>
<th>Filters</th>
<th>Operators</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>DNS RPZ</td>
<td>Query Name</td>
<td>equals, begins with, and ends with</td>

</tr>
</tbody>
</table>

You can override your Publish settings configured for the Cisco ISE server.

- For IPAM and DHCP Lease events: In the Notify the target section, there are predefined data types in the Available table you can publish. Click Override and use the arrows to move data types from the Available table to the Selected table and vice versa.
versa. The appliance sends information for all data types that are added to the Selected table. If you do not override, the publication settings is inherited from those configured while adding the Cisco ISE server. Note that you can configure only one IPAM rule per Cisco ISE server.

- **Action**: The action to be taken for various events. Displays Quarantine the end host for DNS RPZ and Security ADP events.

4. Click **Next** to select Grid members. You can apply this notification rule on specific Grid members or apply this notification rule on all the Grid members.

   - **Apply rule to relevant members**: Select this option to apply notification rule on specific Grid members.
   - **Select Member(s)**: Select this option to select a Grid member for applying the notification rule. If there are multiple members, the Member Selector dialog box is displayed, from which you can select a member. Click the required member name in the dialog box. You can also click **Clear** to clear the displayed member and select a new one.

5. Click **Save** to save the Cisco ISE configuration.

**Examples**

The following illustrations show sample notification rules and how the information is displayed in Grid Manager and the Cisco ISE:

*Figure 44.1 Sample Notification Rule for RPZ Events*

*Figure 44.2 Matching DNS RPZEEvents*
Chapter 45 Ecosystem - Outbound Notifications

This chapter describes how you can use outbound templates to convert NIOS specific events into outbound notifications and send the notifications to REST (REpresentational State Transfer) enabled and DXL (Data Exchange Layer) endpoints. It also explains how to create and add RESTful API and DXL templates that use NIOS specific data to construct outbound notifications, and how to configure notification rules to trigger outbound notifications based on the parameters defined in the templates. It also includes sample templates for supported servers. It includes the following sections:

- Outbound Notification Overview
- Licensing Requirements
- Administrative Permissions
- Best Practices for Outbound Notifications
- About Outbound Templates
  - Creating Session Management Templates
  - Creating Action Templates
  - Action Template Variables and Name Spaces
  - Action Template Variable Format
  - Command Execution
  - Variable Examples
  - Event Variables
  - Result Parsing
  - Adding Outbound Templates
  - Modifying Outbound Templates
  - Viewing Outbound Templates
  - Deleting Outbound Templates
  - Exporting Template Schema
- Configuring Outbound Endpoints
  - Modifying Outbound Endpoints
  - Viewing Outbound Endpoints
- Configuring Notification Rules
  - Adding Notification Rules
  - Deduplicating RPZ Events
  - Selecting Action Template
  - Modifying Notification Rules
  - Viewing All Notification Rules
- Sample Templates
  - Session Management Template
  - Login Template
  - Logout Template
  - Action Template

Outbound Notification Overview
You can use the RESTful API and DXL fabric to obtain core network service information from the Infoblox Grid to assist with profiling the source or destination of network devices or use the RESTful API and WAPI in DXL template to change configurations in the Infoblox Grid to help mitigate security threats. In addition to querying inbound data and changing system configurations and query interfaces, you can use the RESTful API and DXL messages to send outbound notifications so you can prioritize your security needs by detecting new hosts or networks or managing network access control.

When there are serious threats, it is important that you receive notifications so you can address the threats accordingly. On the other hand, you may sometimes need to identify and manage low-risk or accidental threats so the endpoint performance is not negatively affected. For example, if a user inadvertently browses to a faulty web site and you have configured RPZ rules to block this site, you may want to receive notifications and take certain actions so the user is not being blocked or quarantined. In addition, when the Infoblox appliance detects a new host or network, the detection might trigger a vulnerability scan by services such as Qualys and a scan for RPZ events configured in NIOS. In this scenario, you might want to configure conditions to capture these events so you can receive outbound notifications and perform appropriate actions to handle the situation.

To enable outbound API notifications, you must have the Security Ecosystem license installed in your Grid. Depending on the notification rules for RPZ and threat protection event types you want to configure on NIOS, you may need to install the applicable licenses. For information about other licensing requirements, see Licensing Requirements.

The outbound notification feature employs the following mechanism to enable and deliver event-driven messages to configured endpoints:

1. Accepts the configuration of events that you want to monitor (such as RPZ hits) and the configuration of endpoints to which you want to send outbound notifications.
2. Filters events for specific data sets or thresholds, such as RPZ hits for a specific domain within a specific time interval.
3. Matches the selected events and conditions defined in the templates to create outbound messages.
4. Sends outbound notifications to the configured endpoints.

For example, you can first configure RPZ rules to mitigate a malicious IP address, and then configure RESTful API and DXL endpoints to which you want to send the outbound notifications. When configuring your notification rules, you can match RPZ events that are initiated by the RPZ rules and apply the outbound template containing actions to mitigate the threat. The configuration rules then trigger outbound notifications, and the appliance sends the notifications to the configured endpoints and applies the configured actions to combat the offensive IP address. Before you configure the appliance to send outbound notifications, there are a few limitations you might want to consider, as described in Best Practices for Outbound Notifications. For detailed information about how to use the outbound notification feature, see Configuring Outbound Notifications.

Note: To access online resources about this feature, including training videos and sample outbound templates for supported ecosystem partners, ensure that you visit the Infoblox Community Site at [https://community.infoblox.com](https://community.infoblox.com).

For debugging purposes, you can look at the syslog to see if the Outbound service has been started or stopped on specific members. You can also set the logging level to Debug to view all events in the log files, including deduplicated events. However, leaving the logging level at the Debug level could negatively affect your system performance. Therefore, Infoblox does not recommend leaving the logging level at Debug. For information about how to configure the severity level and deduplication, see Configuring Outbound Endpoints.

### Licensing Requirements

You must install the Security Ecosystem license to enable outbound API notifications. After you install the Security Ecosystem license, you can configure REST and DXL endpoints. If you do not have this license installed, the outbound notification feature is disabled. You might also need the following licenses to configure notification rules for certain event types:

<table>
<thead>
<tr>
<th>License</th>
<th>Event Types</th>
</tr>
</thead>
<tbody>
<tr>
<td>RPZ</td>
<td>DNS RPZ</td>
</tr>
<tr>
<td>DNS and DHCP</td>
<td>DHCP Lease</td>
</tr>
<tr>
<td>Threat Analytics</td>
<td>DNS Tunneling</td>
</tr>
</tbody>
</table>

For information about how to install licenses, see Managing Licenses.

### Administrative Permissions

Only superusers can add, edit, and delete REST endpoints and notification rules by default. Limited-access admin groups can perform these tasks only if their administrative permissions are defined. For information about administrative permissions, see About Administrative Permissions.

### Best Practices for Outbound Notifications

The following are some best practices and limitations you might want to consider while configuring outbound notifications:
• You can configure REST and DXL endpoints only on the Grid Master and Grid Master Candidate, but not on Grid members.
• During a scheduled full upgrade in the Grid, you cannot modify any configuration related to the outbound feature until all Grid members are upgraded.
• Outbound notification is not supported during an HA failover. Any events that are in transit during a failover might be lost.
• When you remove or disable a notification rule, no new events will be triggered. However, the appliance continues to process events that are already in queue.
• The buffer to temporarily hold events are limited and not configurable in this release. In very unlikely conditions, events may be dropped due to a full buffer. If events are dropped, summary information is logged to the syslog to indicate the type of events and the number that have been dropped. If this issue occurs continuously, contact Infoblox Technical Support.
• Events generated due to changes made by admin users do not support the Microsoft Management feature. The appliance does not generate events when there are changes done from the Microsoft servers. However, if you make changes that need to be synchronized to the Microsoft servers, the object change event is generated before the changes are synchronized with the Microsoft servers.
• The Grid Master Candidate will continue to perform event enrichments and outbound API calls during and after a Grid Master promotion.
• If you disable the outbound notification feature or make changes to stop future notifications sent to an endpoint, all notifications that are currently in queue for that endpoint will stop immediately.
• The appliance uses rate limiting to control both data collection from Grid members and outbound notifications to external endpoints. It is possible for the appliance to drop events if its buffer is full or if there is a loss of connection between the Grid Master and the Grid members. Logs for these events are consolidated and logged to the syslog.
• The number of outbound notifications sent to external endpoints can be limited, depending on the requirements configured for the external servers. For example, some REST enabled servers only take 10 API calls per second. Some servers might put a user in suspended mode if the number of API calls sent to the user exceeds the limit. If necessary, you can adjust the rate limit criteria for API calls on the external servers.

**Configuring Outbound Notifications**

To send outbound notifications to an endpoint, you must configure notification rules specifying the target endpoints, notification rule criteria, and the outbound templates you want to use. The REST API endpoint you configure must be REST enabled so they can handle RESTful API calls. The DXL endpoints must be connected to DXL brokers and listen on specific DXL topics as configured in the DXL action template. A notification rule contains the target endpoint to which you want to send outbound notifications and the event type upon which you want to take action. The event type you select in a notification rule must match the event type defined in the template you want to use for that rule. Otherwise, the appliance returns an error. Therefore, you must first create and upload outbound templates to the Grid, and then select the correct template you want to apply to the notification rule.

To configure outbound notifications, complete the following:

1. Prepare outbound templates that you want to use for notification rules. For more information about API templates, see [About Outbound Templates](#). You can also reference sample API templates for supported ecosystem partners and modify them accordingly.

   **Note:** To access online resources about this feature, including training videos and sample API templates for supported ecosystem partners, visit the Infoblox Community Site at [https://community.infoblox.com](https://community.infoblox.com).

2. Upload outbound templates to the Grid so you can use them for corresponding notification rules. For more information, see in [Adding Outbound Templates](#).

3. Configure endpoints to which you want to send outbound notifications. For more information, see [Configuring Outbound Endpoints](#).

4. Select event types and configure criteria for notification rules. For more information, see [Configuring Notification Rules](#).

**About Outbound Templates**

The appliance uses outbound templates to convert NIOS events into REST API and DXL messages. You use supported variables in the templates to get respective events and define actions you want to take for those events. The following are outbound templates you can create. You can also export the schema from the appliance and use it to create the outbound templates. For information about how to export template schema, see [Exporting Template Schema](#). Note that the exported schema is in the IETF JSON Schema format. For information about this schema format, see [https://tools.ietf.org/html/draft-zyp-json-schema-04](https://tools.ietf.org/html/draft-zyp-json-schema-04).

- **Session Management Template**: A session management template contains specific variables about an endpoint, such as the timeout value and rate limiting information. For more information, see [Creating Session Management Templates](#).
- **Action Template**: An action template defines the action(s) to be taken on the selected endpoint for the matching event type(s). It contains scripts the appliance uses to query respective event data from NIOS and to perform actions you want to take in response to the events. For more information, see [Creating Action Templates](#).

After you create your outbound templates, you can do the following to manage them:

- Add outbound templates to the Infoblox Grid, as described in [Adding Outbound Templates](#).
- Modify outbound templates, as described in [Modifying Outbound Templates](#).
- View the list of outbound templates that have been uploaded to the Grid, as described in [Viewing Outbound Templates](#).
- Delete outbound templates, as described in [Deleting Outbound Templates](#).

Copyright ©2019, Infoblox, Inc. All right reserved.
Creating Session Management Templates

You can use a session management template to specify settings that will be applied to an endpoint. You can define settings such as the timeout value after which the outbound requests are aborted. This template can also contain additional child templates that can be referenced by the configuration. However, you cannot reference other templates in the system from the session management template.

Once you upload a session management template to the Grid, the configuration in the template automatically applies to the specified endpoint, if the connection to the endpoint has been established and if the template is assigned to the endpoint.

Table 45.2 lists the supported variables you can use in a session management template.

Note: Changes made to the variables of the template through Grid Manager overrides the variables in the template. Although the latest template version is 3.0, versions 2.0 and 1.0 templates still work fine with version 2.0 and version 1.0 syntax respectively.

Table 45.2 Session Management Template Variables

<table>
<thead>
<tr>
<th>Variable</th>
<th>Type</th>
<th>Mandatory</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>version</td>
<td>Must be 3.0</td>
<td>Yes</td>
<td>The version number of the template. Note that 3.0 is the latest version. The appliance still fully supports the previous schema version.</td>
</tr>
<tr>
<td>type</td>
<td>Must be REST_ENDPOINT for REST API endpoints Must be DXL_ENDPOINT for DXL endpoints</td>
<td>Yes</td>
<td>The template type.</td>
</tr>
<tr>
<td>name</td>
<td>String</td>
<td>Yes</td>
<td>The template name.</td>
</tr>
<tr>
<td>vendor_identifier</td>
<td>String</td>
<td>Yes</td>
<td>The vendor identifier for an endpoint.</td>
</tr>
<tr>
<td>comment</td>
<td>String</td>
<td>No</td>
<td>Additional information.</td>
</tr>
<tr>
<td>path</td>
<td>String</td>
<td>No</td>
<td>Path string to append to what the user enters in the GUI.</td>
</tr>
<tr>
<td>override_path</td>
<td>Boolean</td>
<td>No</td>
<td>If present, the path above replaces the path the user enters in the GUI.</td>
</tr>
<tr>
<td>timeout</td>
<td>Integer</td>
<td>No</td>
<td>The timeout value in seconds. The minimum is 1 and the maximum is 3600. The default is 30.</td>
</tr>
<tr>
<td>keepalive</td>
<td>Boolean</td>
<td>No</td>
<td>The value can be True or False. The default is False.</td>
</tr>
<tr>
<td>keepalive_timeout</td>
<td>Integer</td>
<td>No</td>
<td>The keepalive timeout value in seconds. The connection is closed after this timeout. The minimum is 1 and the maximum is 300. The default is 5.</td>
</tr>
<tr>
<td>dxl_keepalive_timeout</td>
<td>Integer</td>
<td>No</td>
<td>The keepalive timeout value in seconds with a connected DXL broker. This controls the rate at which the client will send ping messages to the broker if there is no exchange of other messages. The minimum is 1 and the maximum is 3600. The default is 30. Note: This field is applicable only for the DXL templates.</td>
</tr>
<tr>
<td>dxl_topic</td>
<td>String</td>
<td>No</td>
<td>The DXL topic that is used to send data by DXL. Note: This variable is applicable only for the DXL templates</td>
</tr>
<tr>
<td>retry</td>
<td>Integer</td>
<td>No</td>
<td>The number of attempts to try to connect to the endpoint before considering the connection a failure (this covers only timeout/network errors). The default value is 2.</td>
</tr>
<tr>
<td>retry_template</td>
<td>Integer</td>
<td>No</td>
<td>The number of attempts the appliance retries the full template if it returns a failure (this covers a template returning anything but 200). The default value is 0 (no retry).</td>
</tr>
<tr>
<td>rate_limit</td>
<td>Float</td>
<td>No</td>
<td>The maximum number of messages (per second) that are sent to an endpoint. The default value is 0 (no rate limiting). You can enter a value less than 1.0 to have lower rate limits. For example, if you set the value to 0.5, the appliance sends less than 1 message in every 2 seconds.</td>
</tr>
<tr>
<td>Variable</td>
<td>Type</td>
<td>Access</td>
<td>Description</td>
</tr>
<tr>
<td>--------------------------</td>
<td>-----------------------</td>
<td>--------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>rate_limit_requests</td>
<td>Integer</td>
<td>No</td>
<td>Use this along with rate_limit_interval to define the absolute number of requests for rate limiting. For example, if you set this to 10 and rate_limit_interval to 5000 milliseconds, no further requests are sent until the number of requests falls below 10 in 5000 milliseconds. So if 3 requests are sent at 0 second and 7 requests are sent at the 3rd second, no requests will be sent until the 5th second, where 3 requests are allowed for another 3 seconds. The default is 0 = no rate limiting. You can set this to an integer between 0 and 267840000000.</td>
</tr>
<tr>
<td>rate_limit_interval</td>
<td>Integer (in milliseconds)</td>
<td>No</td>
<td>Use this along with rate_limit_requests to define the rate limiting interval. The default is 0 = no rate limiting. You can set this to an integer between 0 and 267840000000 milliseconds.</td>
</tr>
</tbody>
</table>
| rate_limit_reset         | Integer (in epoch time) | No     | Use this together with rate_limit_requests and rate_limit_interval to reset the epoch time for rate limiting. You can set this to an integer between 0 and 4102437600 milliseconds.  
  Example: If rate_limit_requests = 10, rate_limit_interval = 5 seconds, and rate_limit_reset = 3 p.m. on 10 January 2017 (set in epoch time), 10 requests can be sent within 5 seconds after the reset time.  
  For instance, 3 messages are sent at the 1st second and 7 messages sent at the 3rd second and no more messages can be sent in the next 2 seconds, which is within 5 seconds after 3 p.m. on 10 January 2017. |
| endpoint_variables       | List of VARIABLE structs | No     | If specified these will be accessible via the S: namespace in templates.                                                                                                                                       |
| inactivity_interval      | Integer (in milliseconds) | No     | A logout request is sent after this time interval, provided no other requests have occurred during this time period. The default is 0 = “disable.” You can set this to an integer between 0 and 2^63-1 milliseconds. |
| login_template           | String                | No     | The template that requires user login if there is no active session currently running for the endpoint. Only templates with event_type set to SESSION are supported for this. You must include the template name in the string. Ensure that you upload the login template if you plan to use this variable in the session management template. |
| logout_any_condition     | Boolean               | No     | Specifies whether a logout request is sent, depending on whether logout_status_code or logout_regexp are set. The value can be True or False. The default is False. If this is set to True, a logout request is triggered if either logout_status_code or logout_regexp is set. If this is set to False, both logout_status_code and logout_regexp must be set. |
| logout_regexp            | String                | No     | Any response returned by the endpoint that matches the regular expression in this field will trigger a logout request.                                                                                           |
| logout_status_code       | Integer               | No     | The HTTP response status code used for the provisional response will trigger a logout request. The default is 0 = “disable.” Valid values are between 0 and 599.                                                            |
| logout_template          | String                | No     | The template that is being executed after steps are executed or after various session duration constraints are met. You must include the template name in the string. Only templates with event_type set to SESSION are supported for this. Ensure that you upload the logout template if you plan to use this variable in the session management template. |
| requests_per_session     | Integer               | No     | The number of requests that are sent before a logout request is sent. The default is 0 = “disable.” You can set this to an integer between 0 and 2^63-1.                                                            |
| logout_only_at_template_end | Boolean             | No     | The value can be True or False. The default is False. If this is set to True, a logout request is sent only after the execution of the template has been completed to ensure that all template requests pertaining to a session are executed if that is required by the API. Therefore, it is possible to set requests_per_session to 1 and have each template call executed in its own session regardless of the number of requests it contains. |
| session_cooldown         | Integer (in milliseconds) | No     | When this is set, a login request will be sent only after the amount of time set for this has been elapsed after a logout. The default is 0 = “disable.” You can set this to an integer between 0 and 2^63-1 milliseconds. |
| session_duration         | Integer (in milliseconds) | No     | The time interval after which a logout request is sent unconditionally after a login. For example, if you sent this to 150 milliseconds, after a login, a logout will be sent after 150 milliseconds whether there is current traffic or not. The default is 0 = “disable.” You can set this to an integer between 0 and 2^63-1 milliseconds. |
### Creating Action Templates

The purpose of an action template is to convert an event into one or more RESTful API and DXL messages that are sent from the NIOS appliance to the endpoint configured in the notification rule. An action template consists of a series of statements that are interpreted into specific actions. When creating an action template, ensure that it consists of an initial section with some general template settings, followed by one or more steps that are executed in sequence. Steps are constructed for sending messages to the endpoint and for receiving responses. It can also perform specific operations on template variables.

**Note:** The steps in an action template are executed sequentially. Some constructs enable steps to be skipped by jumping forward in the list of steps; jumping backwards is not supported.

Consider the following guidelines while composing action templates:

- Template error handling is active only if the severity level for logging is set to **Debug**, otherwise error handling is disabled and the server continues to execute a template even if the template tries to access nonexistent variables or perform invalid operations such as trying to increment a STRING variable. For information about setting the severity level for logging, see [Configuring Outbound Endpoints](#). If you have disabled template error handling, then accessing any nonexistent variables will return an empty string and invalid operations are not executed.
- Matching a regular expression is performed un-anchored. If anchoring is required, you must add the characters ^ and/or $ to the respective regular expression.
- For outbound notifications, only template instances are considered. Template instances are constructed from action templates as well as template instance variables in the template. You may configure these variables through Grid Manager when a specific template is associated to an event.

An action template consists of the variables and elements listed in [Figure 45.3](#).

**Note:** When "yes" is indicated in the "Sub" column for a variable, it means that variable substitution (where it is possible to have ${...} variables as part of the value, and have them substituted when the template is executed) is supported for that variable, a * means that the substitution is supported for some of the fields of the struct.

<table>

To avoid possible endless loops, you can limit an individual step to be executed up to a certain number of times. If a step is executed again after the limit is reached, the execution will be interrupted and a failure is logged. The default is 10. The maximum number is 1000.</td>
</tr>
</tbody>
</table>

**STEP Struct**

Each step can perform a different operation, such as SLEEP, CONDITION, NOP, GET, POST, PATCH, DELETE, DXL_EVENT_SEND, or PUT. Table 45.4 lists the step variables.

**Note:** The name for each step must be unique.

- **SLEEP:** Steps with a SLEEP operation will pause the execution for the number of seconds specified in the timeout parameter.
- **NOP:** Steps with a NOP operation will only parse the text specified in body/body_list without sending it to the endpoint. This can be useful for executing operations on variables to prepare data for subsequent steps.
- **CONDITION:** Steps with a CONDITION operation will cause a condition specified in statements to be matched. See Table 45.10 for information about condition variables and Table 45.11 for statement variables.

If the condition matches, the execution of the template will do the following:

- Stop without errors if the stop field is present,
- Stop with an errors if the error field is present,
- Jump forward to the specified step if the next field is present,
- and/or evaluate the text in eval if the field is present.

If the condition does not match, the text in the else_eval field will be evaluated instead, if the field is present.

- GET, POST, PATCH, DELETE, and PUT: These steps will result in an endpoint communication. The request will be sent to an URI composed by the URI configured in the endpoint, plus the path configured in the session management template if present (or replaced by it, depending on its override setting), plus the path configured in the event template if present (same override considerations), plus the path configured in the individual step if present (same override considerations).

  After variable substitution, any data present in the H: namespace will be sent as headers, any parameters listed will be sent as URI parameters, and any data in body/body_list will be sent as the body of the request. Note also that each step can override the endpoint timeout. This is useful when a certain operation is known to require a longer execution time.

  If the result variable is set in the step, the reply from the server will be evaluated and compared against the specified codes and/or REGEX, and the operation specified in the result step will be executed.

  If parse is set in the step, the result from the server will also be parsed and be made available in the P: namespace as described above.

### Table 45.4 STEP Structs

**Note:** Set the "wapi" field to send WAPI requests to the Grid Master using available event data. For example, you can add or modify extensible attributes of a NIOS object at the time when the object is being synchronized. If you include the "wapi" field in a step, you must enable WAPI integration by entering the WAPI login username and password while configuring the endpoint. Otherwise, the WAPI step will fail due to an authorization error. For information about how to configure endpoints, see Configuring Outbound Endpoints.

<table>
<thead>

<td>This is an alternative to the body. If specified, the strings in the list will be joined before sending it. Any leading or trailing whitespace is removed.</td>
</tr>
<tr>
<td>no_connection_debug</td>
<td>Boolean</td>
<td>No</td>
<td>No</td>
<td>The valid value is True or False. If this is set to True even if the endpoint is set to a Debug level logging, only the body, headers, and cookies for the corresponding step will NOT be output to the debug log. Only explicit DEBUG calls will be displayed. This is generally used in login templates to avoid usernames and passwords from being logged to the log files in plain text.</td>
</tr>
</tbody>
</table>
### VARIABLEOP Struct

**Note:** All variables listed in the following table are applicable only for the VARIABLEOP operation in the STEP struct. The VARIABLEOP struct converts specified keys/values in a complex variable (such as LIST, DICTIONARY, or XML values with attributes) or performs operations on an existing complex variable. No schema validation is made for variable combinations. Validation of the schema is performed when you add or modify the action template.

<table>
<thead>
<tr>
<th>Variable</th>
<th>Type</th>
<th>Mandatory</th>
<th>Sub</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>source</td>
<td>String</td>
<td>No</td>
<td>Yes</td>
<td>You must specify the variable name, including the namespace. Example: L:DICT[key][list]</td>
</tr>
<tr>
<td>destination</td>
<td>String</td>
<td>No</td>
<td>Yes</td>
<td>You must specify the variable name, including the namespace. Example: L:DICT[key][list]</td>
</tr>
<tr>
<td>operation</td>
<td>ENUM</td>
<td>Yes</td>
<td>Yes</td>
<td>Specifies the operation being performed for the value defined or created in type. The valid value is one of the following: PUSH, POP, SHIFT, UNSHIFT, or ASSIGN. Note that both operation and type are mandatory for the struct. For examples, see Using OPERATION in the VARIABLE Struct.</td>
</tr>
</tbody>
</table>
| type       | ENUM           | Yes       | Yes  | Specifies the type of variables for the operation. Valid value is one of the following: LIST, DICTIONARY, COMPOSITE, or SINGLE. This field defines how the values in keys, values, and composite_value are combined to create a variable while operation defines how the variable is being used. The appliance handles keys, values and composite_value differently based on the type you select, as follows:  
  - LIST: keys will be ignored; values will contain the required values and be serialized in a simple list of strings.  
  - DICTIONARY: The list of key/value pairs in keys and values will be put in a simple dictionary.  
  - COMPOSITE: The list of key/value pairs in keys and values will be put in an XMLA dictionary with a name set to name and a value set to either the value in composite_value OR to the value in the variable set in source. See Using the COMPOSITE Type for details about how to use COMPOSITE.  
  - SINGLE: Keys will be ignored; the value will be the first element in the values list. |
| name       | String         | No        | Yes  | This is applicable only if you select COMPOSITE as the variable type. Enter the name value for this type. |
| keys       | List of strings | No       | Yes  | This can contain arbitrary serializable constructs. |
| values     | List of strings | No       | Yes  | This can contain arbitrary serializable constructs. When you specify this field inside any variable operation for the VARIABLEOP step type, it is possible to use the constant of a specific type, instead of using string. For details about how to specify type, instead of using string. For details about how to use constant, see Constant Specification for values. |
| composite_value | String       | No       | Yes  | This can contain arbitrary serializable constructs. |
| destination_key | String       | No       | Yes  | This can contain arbitrary serializable constructs. |
| if_exists  | ENUM           | No        | Yes  | The action taken if the variable exists. The valid value is one of the following: SKIP, ERROR, or NEXT. |
| if_exists_next | String       | No        | Yes  | Enter the name for the next step. |
| condition  | CONDITION Struct | No   |      | This can be specified for POP and UNSHIFT operations. |

### Using the COMPOSITE Type

When you use COMPOSITE as the type in the VARIABLE struct, the list of key/value pairs in keys and values is put in an XMLA dictionary with a name set to name and a value set to either the value in composite_value OR to the value in the variable set in source.
Here is an example of using COMPOSITE as the type when you use the following variables and values:

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>type</td>
<td>COMPOSITE</td>
</tr>
<tr>
<td>name</td>
<td>varname</td>
</tr>
<tr>
<td>keys</td>
<td>['a1', 'a2']</td>
</tr>
<tr>
<td>values</td>
<td>['value is ${L::SOMEVAR}', '2']</td>
</tr>
<tr>
<td>composite_value</td>
<td>&quot;123&quot;</td>
</tr>
</tbody>
</table>

It results in the following:

```json
{
    "<xmla>": true,
    "attrs": {
        "a1": "value is 123",
        "a2": "2",
    },
    "index": {},
    "value": ["123"],
    "name": "varname"
}
```

**Note:** If source is set, the value in source is used as is (this can be seen especially for PUSH operations).

**Using OPERATION in the VARIABLE Struct**

**operation ASSIGN**

If operation is set to ASSIGN, the value in type will be simply put in the variable identified by destination, overwriting any value it might already have.

The following are several examples of the ASSIGN operation having namespace E as follows:

```json
{
    'some_field': 'some_value',
    'some_list': ['item1', 'item2']
}
```

(1) When assigning a single value:

```json
{
    'operation': 'ASSIGN',
    'type': 'SINGLE',
    'destination': 'L:var',
    'values': ['value']
}
```

It returns name space L as follows:

```json
{'var': 'value'}
```

(2) When assigning a list:
(3) When assigning a dictionary:

```json
{
  'operation': 'ASSIGN',
  'type': 'DICTIONARY',
  'destination': 'L:dict',
  'keys': ['$E:A:some_field_1', '$E:A:some_field_2'],
  'values': ['$E:A:some_list[0]', '$E:A:some_list[1]']
}
```

It returns the following:

```json
{'dict': {'some_value_2': 'item2', 'some_value_1': 'item1'}}
```

(4) When assigning a composite value, as follows:

```json
{
  'operation': 'ASSIGN',
  'type': 'COMPOSITE',
  'destination': 'L:composite',
  'name': 'tag_name',
  'keys': ['attr_1', 'attr_2'],
  'values': ['$E:A:some_field', 'another_value'],
  'composite_value': 'tag_content'
}
```

It gives the following:

```json
{'composite': {
  'index': {}, '<xmla>': True,
  'attrs': {
    'attr_2': 'another_value',
    'attr_1': 'some_value'
  },
  'value': ['tag_content'],
  'name': 'tag_name'
}}
```

This composite value can be serialized to the following XML:

```
<tag_name attr_1="some_value" attr_2="another_value">tag_content</tagname>
```
**operation PUSH and SHIFT without setting if_exists**

If `destination_key` is set, the assumption is to push or shift to a dictionary; otherwise, it is to push or shift to a list.

For pushing to a list, if the `destination` variable exists and is a list, the list of values in `values` will be added to the existing list. With PUSH, it means that the values will be added to the right side of the list (at the end) of the list. With SHIFT however, the values will be added to the left side (at the beginning) of the list.

If the `destination` variable is a dictionary, it will be converted to a list that contains only one element with the value appended to it. This means that for XML deserializing and JSON values, it is possible to create a list by pushing it on to an existing scalar value.

For pushing to a dictionary, it means that with `destination_key` set, if the `destination` variable exists and is anything but a dictionary, it is considered as an error. If it is a dictionary however, the value above will be added with its key set to `destination_key` overwriting any existing value.

If the variable denoted by `destination` has a composite value, the COMPOSITE type can be pushed or shifted to it only. If the destination composite value contains text, the text will be replaced with the composite value. In other cases, the PUSH operation using the new value will be added to the right side of the children list. For the SHIFT operation, the new value will be added to the left side of the children list.

The following are several examples of the `ASSIGN` operation having namespace E:

```json
{
'operation': 'PUSH',
'type': 'SINGLE',
'destination': 'L:some_list',
'values': ['$E:A:some_field_right'],
}
```

and namespace L as follows:

```json
{
    'some_list': ['item1', 'item2'],
    'some_dict': {'key': 'val'},
    'compl': {
        'index': {}, '<xmla>': True,
        'attr1_b': 'another_value',
        'attr1_a': 'some_value'
    },
    'value': ['tag_1_content'],
    'name': 'tag_1'
},
'comp2': {
    'index': {}, '<xmla>': True,
    'attr1_b': 'another_value',
    'attr1_a': 'some_value'
}
```

(1) When PUSH or SHIFT to a list:
'It returns namespace L as the following:

{
'some_list': [['left_some_value'], 'item1', 'item2', 'some_value_right']
}

(2) When PUSH or SHIFT to a dictionary, it returns the following:

{'some_dict': {
  'push1': 'item',
  'push2': ['item_1', 'item_2'],
  'key': 'val'
}}

Note: There is no difference between PUSH and SHIFT when destination is DICTIONARY.

(3) When PUSH or SHIFT to a composite value:

{  
  'operation': 'PUSH',
  'type': 'COMPOSITE',
  'destination': 'L:comp1',
  'name': 'pushed',
  'composite_value': ''
},

{  
  'operation': 'SHIFT',
  'type': 'COMPOSITE',
  'destination': 'L:comp1',
  'source': 'L:comp2'
}

It returns the following:

{  
  'comp1': {
    'index': {u'pushed': 1, 'tag_2': 0},
    '<xmla>': True,
    'attrs': {'attr1_a': 'some_value', 'attr1_b': 'another_value'},
    'value': [
      {'index': {}, '<xmla>': True, 'attrs': {}, 'value': ['tag_2_content'], 'name': 'tag_2'},
      {'index': {}, '<xmla>': True, 'attrs': {'attr': 'val'}, 'value': [], 'name': 'pushed'}
    ],
    'name': 'tag_1'
  }
}
Note that the first operation (PUSH) overwrites existing value and the second operation (SHIFT) shifts the value to the existing list. This composite value can be serialized to the following XML:

```xml
<tag_1 attr1_a="some_value" attr1_b="another_value">
  <tag_2>tag_2_content</tag_2>
  <pushed attr="val"/>
</tag_1>
```

**operation PUSH and SHIFT with if_exist set**

If `destination_key` is set, the assumption is to push or shift to a dictionary. Otherwise it is to push or shift to a list.

If you are pushing to a list, and the variable already exists, the operation specified there will be executed as follows: SKIP will not modify the original value, NEXT will not modify and jump to the step specified in `if_exists_next`, and ERROR will instead return an error.

If you are pushing to a dictionary, and the variable matches, there is no need to modify the values because they would already be the same. Therefore, SKIP will be a no-operation, NEXT will not modify and jump to the step specified in `if_exists_next`, and ERROR will instead return an error.

The decision for whether a new value exists or not is a simple comparison with the value/attributes of the existing variables in the list or dictionary in `destination_key`. They all have to match for `if_exists` for the operation to be triggered.

If variable denoted by `destination_key` has a composite value, the semantics is as above, with additional checks. The check is complete before the value is added to the list of children. During the check, the new composite value is compared one by one with the existing values. If the values are the same, the "if_exists" logic is triggered as above.

The following are a few examples using namespace L as follows:

```json
{
    'some_list': ['item1', 'item2'],
    'some_dict': {'key1': 'val1', 'key2': 'val2'},
    'list_of_lists': [['a', 'b'], ['a', '2'], ['1', '2']],
    'composite': {
        '<xmla>': True,
        'index': {'inner_1': 0, 'inner_2': 1},
        'name': 'outer',
        'attrs': {'outer_attr': 'outer_val'},
        'value': [
            {
                '<xmla>': True,
                'index': {},
                'name': 'inner_1',
                'attrs': {},
                'value': ['inner_1_content']
            },
            {
                '<xmla>': True,
                'index': {},
                'name': 'inner_2',
                'attrs': {'inner_attr': 'inner_val'},
                'value': []
            }
        ]
    }
}
```
(1) When PUSH to a list with the item exists:

```json
{
    'operation': 'PUSH',
    'type': 'SINGLE',
    'destination': 'L:some_list',
    'values': ['item2'],
    'if_exists': 'ERROR'
}
```

It triggers the 'if_exists' login. 'ERROR' means stopping the template execution with error, 'SKIP' means 'do nothing for this operation' and 'NEXT' will jump to the step with name specified in 'if_exists_next'.

(2) When PUSH to a dictionary with the item exists:

```json
{
    'operation': 'PUSH',
    'type': 'SINGLE',
    'destination': 'L:some_dict',
    'destination_key': 'key2',
    'values': ['val2'],
    'if_exists': 'ERROR'
}
```

It triggers an error. Note that both key and value should be the same in order to trigger the 'if_exists' logic. If key is the same but value differs, value will be overwritten. If key is different, the new key with value will be added.

(3) When PUSH to a list of list with the item exists:

```json
{
    'operation': 'PUSH',
    'type': 'LIST',
    'destination': 'L:list_of_lists',
    'values': ['a', '2'],
    'if_exists': 'ERROR'
}
```

It triggers an error.

(4a) When PUSH to a composite value with the item exists, as follows:

```json
{
    'operation': 'PUSH',
    'type': 'COMPOSITE',
    'destination': 'L:composite',
    'name': 'inner_1',
    'composite_value': 'inner_1_content',
}
```
It triggers an error.

(4b) When PUSH to a composite value with the item exists, as follows:

```json
{
    'operation': 'PUSH',
    'type': 'COMPOSITE',
    'destination': 'L:composite',
    'name': 'inner_2',
    'keys': ['inner_attr'],
    'values': ['inner_val'],
    'composite_value': '',
    'if_exists': 'ERROR'
}
```

It triggers an error.

**operation POP and UNSHIFT**

If the source variable is anything but a dictionary, a list, or a composite value, an error is returned. If keys is set, the source value is assumed to be a dictionary. Otherwise, an error is returned.

If the source variable is a list, a single value is removed from the list. If the operation is POP, it is removed from the right side (from the end). If the operation is UNSHIFT, it is removed from the left (at the beginning). The removed value is put in the destination variable.

If the source variable is a composite value, the operation is on the children list of the composite value. Note that it is not possible to POP or UNSHIFT from a composite value, if it has text only.

If the source variable is a dictionary, the specified keys and/or key/value pairs will be removed from the variable in source. If only keys are passed, those keys will be unconditionally removed. If keys and values are passed, the key will be removed from the source variable only if its value matches what is passed in values here. If only one key or key/value pair is passed, the removed value will be put in destination. Otherwise, it will simply be dropped.

For the values match, the value in the list or dictionary will be serialized with quoting specified in the template before being compared to the string value passed in values. This also means that using comparison on large lists would potentially be a slow operation.

In the POP or UNSHIFT case, type is validated to be the same as the type of the popped or unshifted variable (you can validate if they were planning to pop a simple scalar if there is one). If it is not, an error will be raised if debug is turned on.

The following are a few examples using namespace L as follows:

```json
{
    'some_list': ['item1', 'item2'],
    'some_dict': {'key1': 'val1', 'key2': 'val2'},
    'list_of_lists': [['a', 'b'], ['1', '2']],
    'list_of_dicts': [{'a': '1'}, {'b': '2'}],
    'composite': {
        '<xmla>': True,
        'index': {'inner_1': 0, 'inner_2': 1},
        'name': 'outer',
        'attrs': {'outer_attr': 'outer_val'},
        'value': [
            
```
(1) When POP from a list:

```
{  
    "operation": "POP",
    "type": "SINGLE",
    "source": "L:some_list",
}
```
It gives the variable as follows:
```
{"some_list": ["item1"]}
```

(2) When UNSHIFT from a list:

```
{  
    "operation": "UNSHIFT",
    "type": "SINGLE",
    "source": "L:some_list",
}
```
It returns the following:
```
{"some_list": ["item2"]}
```

(3) When UNSHIFT from a dict by key:

```
{  
    "operation": "UNSHIFT",
    "type": "SINGLE",
    "source": "L:some_dict",
    "keys": ["key1"]
}
```
It returns the following:
```
{"some_dict": {"key2": "val2"}} There is no difference between POP/UNSHIFT fro dictionarries
(4) When POP from a dict by multiple keys:

```
{
    "operation": "POP",
    "type": "SINGLE",
    "source": "L:some_dict",
    "keys": ["key1", "key2"]
}
```

It returns the following:

```
{"some_dict": {}}
```

(5) When POP from a dict when a key is absent:

```
{
    "operation": "POP",
    "type": "SINGLE",
    "source": "L:some_dict",
    "keys": ["key1", "absent_key"]
}
```

It returns an error in the DEBUG mode. For non-DEBUG mode, all existing keys are POPed. Note that items are popped one by one, so key1 item is popped before the error is returned.

```
{"some_dict":{"key2": "val2"}}
```

(6) When POP from composite value:

```
{
    "operation": "POP",
    "type": "SINGLE",
    "source": "L:composite",
}
```

It returns the following:

```
{
    "composite": {
        "index": {"inner_1": 0},
        "<xmla>": True,
        "name": "outer",
        "value": [{
            "index": {},
            "<xmla>": True,
            "name": "inner_1",
            "value": ["inner_1_content"],
            "attrs": {}
        }],
        "attrs": {"outer_attr": "outer_val"}
    }
}
```
This can be serialized to the following:

```xml
<outer outer_attr="outer_val">
    <inner_1>inner_1_content<inner_1>
</outer>
```

(7) When conditional POP/UNSHIFT from a list:

```
{
    "operation": "POP",
    "type": "SINGLE",
    "source": "L:some_list",
    "values": ["item1"]
}
```

It returns the following:

```json
{"some_list": ["item2"]}
```

There is no difference between POP and UNSHIFT when `values` is specified. When source is either **LIST** or **COMPOSITE**, all occurrences of a value are deleted.

(8) When conditional POP/UNSHIFT from a dictionary:

```
{
    "operation": "UNSHIFT",
    "type": "SINGLE",
    "source": "L:some_dict",
    "keys": ["key2"],
    "values": ["val2"]
}
```

It returns the following:

```json
{"some_dict": {"key1": "val1"}}
```

(9) When conditional POP/UNSHIFT of multiple values:

```
{
    "operation": "UNSHIFT",
    "type": "SINGLE",
    "source": "L:some_dict",
    "keys": ["key2", "key2"],
    "values": ["abc", "val2"]
}
```

It returns the following:

```json
{"some_dict": {"key1": "val1"}}
```

(10) When conditional POP/UNSHIFT with list values:

```
{
    "operation": "POP",
    "type": "SINGLE",
    "source": "L:list_of_lists",
    "values": ["\"[1, '2']\"]
}
```
It returns the following:

```json
{"list_of_lists": [["a", "b"]]}  
```

For conditional POP/UNSHIFT, non-string values are serialized with the template's quoting. For JSON, quoting is added to value.

(11) When conditional POP/UNSHIFT with dictionary value:

```json
{  
  "operation": "POP",
  "type": "DICTIONARY",
  "source": "L:list_of_dicts",
  "values": ["\"{\"b\": \"2\"}\"]
}
```

It returns the following:

```json
{"list_of_dicts": ["{\"a\": \"1\"}"]}
```

(12a) When conditional POP/UNSHIFT with the following composite values:

```json
{  
  "operation": "POP",
  "type": "COMPOSITE",
  "source": "L:composite",
  "values": ["\"{\"index\": {}, \"<xmla>\": True, \"name\": \"inner_2\", \"value\": [], \n  
  \t\"attrs\": {\"inner_attr\": \"inner_val\"}}\"]
}
```

It returns the following:

```json
{
  "composite": {
    "index": {"inner_1": 0},
    "<xmla>": True,
    "name": "outer",
    "value": [{
      "index": {},
      "<xmla>": True,
      "name": "inner_1",
      "value": ["inner_1_content"],
      "attrs": {}
    }],
  "attrs": {"outer_attr": "outer_val"}
  
```

(12b) When conditional POP/UNSHIFT with the following composite values, and with the template quoting set to XMLA, the example in (12a) can be specified as follows:

```json
{  
  "operation": "POP",
  "type": "COMPOSITE",
  "source": "L:composite",
  "values": ["\"{\"index\": {}, \"<xmla>\": True, \"name\": \"inner_2\", \"value\": [], \n  
  \t\"attrs\": {\"inner_attr\": \"inner_val\"}}\"]
}
```

```json
{
  "composite": {
    "index": {"inner_1": 0},
    "<xmla>": True,
    "name": "outer",
    "value": [{
      "index": {},
      "<xmla>": True,
      "name": "inner_1",
      "value": ["inner_1_content"],
      "attrs": {}
    }],
  "attrs": {"outer_attr": "outer_val"}
  
```

Copyright ©2019, Infoblox, Inc. All right reserved.
Type check after POP/UNSHIFT:

```
{
  "operation": "POP",
  "type": "LIST",
  "source": "L:some_dict",
  "keys": ["key2"]
}
```

It returns an error in the DEBUG mode. Since the type of POPed value is not LIST, the possible values for type are 'SINGLE', 'LIST', 'DICTIONARY', and 'COMPOSITE', where 'SINGLE' means 'no check'. Note that type check is done after the item is retrieved from source. In the DICTIONARY case, when several keys are specified, there is no type check. Type check is done after value comparison.

(13) When putting the item to 'destination' :

```
{
  "operation": "POP",
  "type": "COMPOSITE",
  "source": "L:composite",
  "destination": "L:sub_item"
}
```

It returns the following:

```
{
  "composite": {
    "index": {"inner_1": 0},
    "<xmla>": True,
    "name": "outer",
    "value": [
      {"index": {}, "<xmla>": True, "name": "inner_1", "value": ["inner_1_content"],
        "attrs": {}}
    ],
    "attrs": {"outer_attr": "outer_val"}
  },
  "sub_item": {
    "index": {},
    "<xmla>": True,
    "name": "inner_2",
    "value": [],
    "attrs": {"inner_attr": "inner_val"}
  }
}
```
If the value popped/unshifted from source and destination is specified, the value is written to the destination. The value is written after the type check.

The L:sub_item can be serialized as the following:

\[ <inner_2 inner_attr="inner_val"/> \]

**Constant Specification for values**

When you specify the `values` field inside any variable operation for the VARIABLEOP step type, it is possible to use the constant of a specific type, instead of string.

For example, the following describes three string values:

```javascript
'values': ['True', '42', '{}L::some_var']
```

If you specify `values` as `'{X:something}'`, `something` is represented as a constant of type X. Note that this is the only allowed syntax. For example, `text{X:something}` is treated as a string, instead of a constant specification.

The following types are supported in constant specification:

- **Bool type (B):** Both '{B:1}' and '{B:true}' are evaluated as bool true, while '{B:0}' and '{B:false}' are evaluated as bool false. Note that both 'true' and 'false' are not case-sensitive. Therefore, True, FALSE or even tRuE are all allowed. Other invalid values such as 'B:' and '{B:anythingelse}' are evaluated as bool=false (the 'default value') without further debugging; and an error is logged in the debug mode.

- **Integer type (I):** '{I:}' is evaluated to its corresponding integer value. For example, '{I:-42}' is evaluated as integer -42. The default value is 0.

- **Empty type (E):** '{E:}' is evaluated as None. '{E:[]}' is evaluated as an empty list. '{E:{}}' is evaluated as an empty dictionary. The default value is None.

- **Float type (F):** The float type is similar to the integer type. Float numbers can be specified as '{F:0.0}', '{F:-4.2}', '{F:-4E+2}' or '{F:+1.23e-45}'. The default value is 0.0.

- **String type (S):** '{S:}' is evaluated as string '. For example, '{S:42}' is string '42'. There is no default value for string. For the unknown type (e.g. '{U:%^&}'), the default value is an empty string.

The following example illustrates how to use constant specification to define ipv4addr with a DHCP option:

```javascript
{
  "ipv4addr": "1.2.3.4",
  "options": [
    {
      "name": 'dhcp-lease-time",
      "num": 51,
      "use_option": true,
      "value": '43200",
      'vendor_class': "DHCP"
    }
  ]
}
```

Note that `num` is an integer (in this string: "num": "51") and `use_option` is bool (in this string: "use_option": "true").

In the action template, you can do the following:

```javascript
{
  "steps": [
    {
      "operation": 'VARIABLEOP",
      "variable_ops": [
        {
          "operation": "ASSIGN",
```
"type": "DICTIONARY",
"destination": "L:addr",
"keys": ["ipv4addr", "options"],
"values": ["1.2.3.4", "{E:[]}"]
},
{
"operation": "PUSH",
"type": "DICTIONARY",
"destination": "L:addr{options}"",
"keys": ["name", "num", "use_option", "value", "vendor_class"],
"values": ["dhcp-lease-time", "{I:51}", "{B:true}", "43200", "DHCP"]
}
}
,
{
"operation": "PUT",
"transport": {"path": "record:host_ipv4addr"},
"body": "${L:J:addr}"
}
]
]
,
{
"operation": "PUT",
"transport": {"path": "record:host_ipv4addr"},
"body": "${L:J:addr}"
}
]

Table 45.6 SERIALIZE Struct

Note: All variables listed in the following table are applicable only for the SERIALIZE operation in the STEP struct. The SERIALIZE structs inside the step are executed in sequence.

<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>Mandatory</th>
<th>Sub</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>content</td>
<td>String</td>
<td>Yes</td>
<td>Yes</td>
<td>Defines what to serialize. This can contain arbitrary variables and text.</td>
</tr>
<tr>
<td>destination</td>
<td>String</td>
<td>Yes</td>
<td>Yes</td>
<td>Defines the destination for the serialization.</td>
</tr>
</tbody>
</table>

TRANSPORT Struct

Table 45.7 TRANSPORT Structs

<table>
<thead>
<tr>
<th>Variable</th>
<th>Type</th>
<th>Mandatory</th>
<th>Sub</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>path</td>
<td>String</td>
<td>No</td>
<td>Yes, if specified in step.</td>
<td>If present, it is appended to the endpoint URI.</td>
</tr>
<tr>
<td>override_path</td>
<td>Boolean</td>
<td>No</td>
<td>No</td>
<td>If this is true, the specified path completely overrides the endpoint URI after the first <code>/</code>.</td>
</tr>
<tr>
<td>content_type</td>
<td>String</td>
<td>No</td>
<td>No</td>
<td>If specified, this overrides the endpoint content type.</td>
</tr>
</tbody>
</table>

RESULT Struct

Note the following:
- `codes` and `regex` are ignored if the operation is SLEEP or NOP.
- At least one of the following is required: `next`, `stop`, or `error`.

Table 45.8 RESULT Structs
<table>
<thead>
<tr>
<th>Variable</th>
<th>Type</th>
<th>Mandatory</th>
<th>Sub</th>
<th>Description</th>
</tr>

<tr>
<td>op</td>
<td>ENUM</td>
<td>Yes</td>
<td>No</td>
<td>The operation to execute. This can be one of the following: =, &gt;, &lt;, &gt;=, &lt;=, =<del>, and !</del>. Note that the &gt;, &gt;=, and &lt;= operations try to convert the operands to numbers before executing the comparison, then =<del>, and !</del> are REGEX matches and the right side is considered the REGEX.</td>
</tr>
</tbody>
</table>
Action Template Variables and Name Spaces

Action templates can access variables in several different name spaces. The following are the available name spaces:

- **C**: http cookies. It supports only the DEL operation (primarily for logout purposes), but it can be used as a substitution origin.
- **Read-Only E**: Event data.
- **H**: http headers. Note that the assigned variables are sent in the next HTTP request and it survives the template execution.
- **Read-Only I**: Template instance variables. It is set in the GUI during the creation of the filter and it also includes the endpoint variables that are set in the GUI when creating an endpoint. Note that the instance variables can override endpoint variables, if needed.
- **L**: Local template variables. This name space is empty at name space startup and will not survive the template invocation.
- **Read-Only P**: Previous endpoint response values (if parsing is enabled for the response.)
- **Read-Only R**: Previous endpoint request http-specific return values. This includes RC, the http status code of the previous request (Example: 200), BODY, and the body of the response.
- **Read-Only RH**: Previous endpoint request that returned http headers.
- **S**: Endpoint session state variables. These variables survive the template invocation (it is used similar to L: name space which is not cleared at the end of the template execution.)
- **Read-Only UT**: Read-only utility variables. The UT: name space contains the following read-only variables:
  - **EPOCH**: EPOCH seconds since Jan 1st, 1970 (integer, 1 second resolution.)
  - **UUID**: Random UUID of the form 00000000-0000-0000-0000-000000000000.
  - **PROTOCOL**: The protocol used for the request.
  - **URI**: Complete URI used for the request.
  - **HOST**: The endpoint address.
  - **PORT**: The port used for the request.
- **Read-Only XC**: Execute a command on the variable. This results no output.

Action Template Variable Format

The following sequences are substituted with dynamic data:

\${<data namespace>:<output format>:<name of the data or operation dependent values>}

The sequences cannot contain the following characters as variable names: {, }, [ and ]. Therefore, if names contain keys of dictionary/EA variables, they must be quoted with the \ character. Example: "${{E::SOME_EA{name with \ embedded \ braces or brackets}}". But if the \ character is desired, it must be quoted as \\ Note that variable substitution happens only once, it is not nested (i.e. if the value contains $\{...}, it will not be recursively substituted). Also, the dynamic data is not supported for instance and template variables which are assumed to be immediate values.

The following types of variables allow further qualifiers after the variable name. The qualifiers are always mandatory. Therefore, if a variable is a list or a dictionary, then you must specify [ ] or { }.

- **EA** (Extensible Attribute) variables or dictionaries. In general, you must specify [EName] for EA variables or dictionaries. For example, if you specify $[E::NETWORK_EA{City}], it means the city EA from the network EAs. Note that data specific portion is mandatory for EA variables.
- **List variables.** You can specify the list index using square brackets. For example, for a list of DNS names if you specify $[E::DNS_NAMES[0]], this indicates the first DNS name in the list.

You can also use { } or [ ] to signify the full dictionary or list that is supported only in some encodings. Optionally, you can specify the output format. The following output formats are supported:

- **J**: The output is in the form of JSON formatted variable. It supports deserializing lists as well as dictionaries. Note that strings will have double quotes prepended/appended when serialized with J.
- **j**: The output is in the form of JSON formatted variable. It supports deserializing lists as well as dictionaries without the leading or trailing double quotes, if the variable is a string.
- **X**: The output is in the form of XML formatted variable. It supports deserializing lists, such as < item >... </item > sequence.
- **U**: The output is in the form of url encoded variable. It supports deserializing lists and the output will be a string (comma separated value.)
- **A**: The output will be a variable, which is as-is.
- **S**: The output is in the form of a string. This is the default for JSON if you do not specify any output format. By default, even numbers will be serialized as JSON strings, meaning the output in a JSON quoted template for a numerical value of 1234 will be "1234".
- **N**: The output is in the form of numbers. For example, if the variable is a boolean, the output will be 0, 1, etc.
- **B**: The output will be a boolean, that is true/false.
- **L**: The length of the variable. This is supported only for lists (the length of the list) and dictionaries (the number of keys).
- **T**: The type of the variable. This can be one of the following characters: ‘S’ for strings, ‘L’ for lists, ‘D’ for dictionaries, ‘B’ for booleans, ‘N’ for numbers, and ‘O’ for otherwise.

The default is set by the template quoting option and by using a variable. If you have not set the template quoting, then JSON will be set, by default. If you have set the template quoting, the output format will be as specified, unless the variable is in the following fields:
**Command Execution**

If you use XC: name space, then the value can be one of the following:

**Note:** The argument will be one or two nested variable specifications separated by `:` but without the `$` symbol. The variables inside 'XC' do not have an output format, so you must use only one `:`.

- **ASSIGN**: Assigns the value to the specified variable. Note that the value assigned is in the format I/S/B:value for integer, string, and boolean values. Example: ASSIGN:variable:value.
- **DEBUG**: Outputs the specified variable to the debug file (if the log level is not set to DEBUG, this will be ignored), if only the name space is used, the whole name space will be printed.
- **INC**: Increments the variable value. If the value is not a number, NIOS displays an error.
- **DEC**: Increments the variable value. If the value is not a number, NIOS displays an error.
- **COPY**: Copies one variable into another. Example: COPY:destination:source.
- **DEL**: Removes the variable. This supports only the C:, H:, L:, and S: name spaces.
- **FORMAT**: Formats the value according to what is specified after the second `:`. Currently, NIOS supports the following formats:
  - **U**: Converts to uppercase value.
  - **L**: Converts to lowercase value.
  - **DATE_EPOCH**: Assuming that the value is a date expressed in UTC ISO 8601 date format. For example, 2016-03-13T04:50:31Z will be converted to EPOCH seconds.
  - **DATE_ISO8601**: Assuming that the value contains EPOCH seconds. The value is converted to a date string expressed in UTC ISO 8601 date format. For example, 1467152565 will be converted to 2016-06-28T22:45Z. If the variable contains milliseconds, they will be preserved. For example 1467152565.57 will be converted to 2016-06-28T22:45:57Z.
  - **DATE_STRFTIME**: Assuming that the variable contains EPOCH seconds. The value is converted to a date string with the specified format which is passed as the second parameter to the function.
  - **PUNYCODE_TO_UTF-8**: Assuming that the variable contains a punycode encoded domain name. The domain name representation will be converted to UTF-8 characters. Note that there might be a failure if the domain name has non-UTF-8 characters in its wire format.
  - **TRUNCATE**: Assuming that the variable is a string and it will be truncated as specified. The format is a number (positive or negative) followed by the letter 'f' or 'r'. The number is the starting character of the string (positive will be counted from the beginning, negative will be counted from the end) and 'f' defines if the characters are from, after, or to that point. For example, if a string is 12345, then 1f will produce 2345, 1t will produce 1, -1f will produce 5 and -1t will produce 1234.

Format operations will function like other operations if an error occurs, but the variable is not modified. However, the error can be ignored if the log setting is not set to Debug. For information about how to set the logging level, see Configuring Outbound Endpoints.

The following are some examples of using XC operations to increment and decrement IP address strings, create a network range, or remove a specific IP address.

**Incrementing or Decrementing IP addresses**

Use the **INC** and **DEC** operations respectively to increment and decrement IP address strings.

**Examples:**

- For namespace `{L:{'ip_str': '1.2.3.4'}}, an evaluating variable '#{XC:DEC:{L:ip_str}}' results in `{L:{'ip_str': '1.2.3.3'}}.
- The same goes for IPv6 addresses. For namespace `{L:{'ip_str': '2001:db8::2}}`, an evaluating variable '#{XC:INC:{L:ip_str}}' results in `{L:{'ip_str': '2001:db8::3'}}`, and an evaluating '#{XC:DEC:{L:ip_str}}' results in `{L:{'ip_str': '2001:db8::1'}}`.

The increment of the last address results in the first address. The decrement of the first address results in the last address.

**Examples:**

- INC of `255.255.255.255` results in `0.0.0.0`
- DEC of `0.0.0.0` results in `255.255.255.255`

**Creating Network Ranges from Strings**

Use the **NETWORKTORANGE** operation to create a range from a network string. This operation should be specified as the following: `{XC:NETWORKTORANGE:{var_with_network}:{var_for_range}}` where network is a string such as `1.2.3.4/16` or `2001:db8:ce4::/48`.

The resulting range is an XMLA value such as the following:

```xml
{
  '<xmla>': True,
  'name': 'range',
}```
or

```json
{
    '<xmla>': True,
    'name': 'range',
    'value': [],
    'index': {}
}
```

**Note:** "Var_with_network" must be a top-level variable in a namespace such as E:var, but not L:var[key][42].

When namespace E is `{E: {net: '1.2.3.4/16'}}` and the response is as follows:

```
<SiteConfigResponse success="1">
    <Site id="42" name="this_site" description="testing site" riskfactor="1.0" isDynamic="0">
        <Description>testing site</Description>
        <Hosts>
            <host>a.com</host>
        </Hosts>
        <Credentials></Credentials>
        <Alerting></Alerting>
        <ScanConfig configID="21" name="CIS" templateID="cis" engineID="3" configVersion="3">
            <Schedules></Schedules>
        </ScanConfig>
    </Site>
</SiteConfigResponse>
```

Then using the following steps:

```json
{
    "name": "copy",
    "operation": "NOP",
    "body_list": [
        "${XC:COPY:{L:Site}:{P:PARSE{SiteConfigResponse}}}",
        "${XC:NETWORKTORANGE:{E:net}:{L:range}}"
    ],
},
{
    "name": "add",
    "operation": "VARIABLEOP",
    "variable_ops": [
        {
            "operation": "PUSH",
            "type": "COMPOSITE",
            "destination": "L:Site{Site}{Hosts}",
            "source": "L:range"
        }
    ],
},
{
    "name": "post",
    "operation": "POST",
    "body_list": [
        '<?xml version="1.0" encoding="UTF-8"?>',
        '<SiteSaveRequest session-id="some_sess_id"',
        '${L:x:Site}',
        '</SiteSaveRequest>'
    ]
}
```
Removing Specific IP Addresses from Hosts or Ranges

Use the `XC:REMOVEIP` operation to remove a specific IP address from a list of hosts or ranges. This operation should be specified as the following: `$(XC:REMOVEIP:{"var_with_ip"}::{"var_with_list"})` where IP address is a string such as `'1.2.3.4'` or `'2001:db8:ce4::42'`.

The list of hosts/ranges is as follows:

```json
[
  {
    '<xmla>': True,
    'name': 'range',
    'attrs': {'from': '1.2.3.1', 'to': '1.2.3.7'},
    'value': [],
    'index': {}
  },
  {
    '<xmla>': True,
    'name': 'host',
    'attrs': {},
    'value': [a.com],
    'index': {}
  }
]
```

**Note:** "var_with_IP" must be a top-level variable in a namespace such as `E:var`, but not `L:var{key}[42]`.

Having namespace `E` as `{ 'E': { 'ip': '1.2.3.4' } }` and Rapid7 response as follows:

```xml
<SiteConfigResponse success="1">
  <Site id="42" name="this_site" description="testing site" riskfactor="1.0" isDynamic="0">
    <Description>testing site</Description>
    <Hosts>
      <host>a.com</host>
      <range from="1.2.3.1" to="1.2.3.7"/>
      <host>b.com</host>
    </Hosts>
    <Credentials/>
    <Alerting/>
    <ScanConfig configID="21" configVersion="3" name="CIS" templateID="cis" engineID="3">
      <Schedules/>
    </ScanConfig>
  </Site>
</SiteConfigResponse>
```

Use the following steps:

```json
{
  "name": "copy",
  "operation": "NOP",
  "body_list": [
```

Copyright ©2019, Infoblox, Inc. All rights reserved.
It returns the following XML results:

```xml
<?xml version="1.0" encoding="UTF-8"?>
<SiteSaveRequest session-id="some_sess_id">
  <Site name="this_site" isDynamic="0" description="testing site" riskfactor="1.0" id="42">
    <Description>testing site</Description>
    <Hosts>
      <host>a.com</host>
      <range from="1.2.3.1" to="1.2.3.3"/>
      <range from="1.2.3.5" to="1.2.3.7"/>
      <host>b.com</host>
    </Hosts>
    <Credentials/>
    <Alerting/>
    <ScanConfig configID="21" configVersion="3" name="CIS" templateID="cis" engineID="3">
      <Schedules/>
    </ScanConfig>
  </Site>
</SiteSaveRequest>
```

**XC:Remove* Operations**

There are several XC:REMOVE* operations that can be used to remove one or more IP specified addresses from a list of hosts and ranges. Such list is the deserialized representation of the 'Hosts' element of the Rapid7 response or request.

For example,

```json
[
  {
    '<xmla>': True,
    'name': 'host',
    'attrs': {},
    'value': ['a.com'],
    'index': {}
  },
  {
    '<xmla>': True,
    'name': 'range',
    'attrs': {'from': '1.2.3.1', 'to': '1.2.3.7'},
    'value': [],
    'index': {}
  },
  {
    '<xmla>': True,
    'name': 'host',
    'attrs': {},
    'value': ['b.com'],
    'index': {}
  }
]
```

Represents the following "Hosts" element:
<Hosts>
    <host>a.com</host>
    <range from="1.2.3.1" to="1.2.3.7"/>
    <host>b.com</host>
</Hosts>

Items in the list are iterated one by one upon execution of any REMOVE command. The first argument of the REMOVE* command is the variable specification that contains an IP address. The second argument is the variable with the list of ranges or hosts. If the item is 'range', then the specified IP address is deleted from the range. Execution of any REMOVE command may result in no range, one range or two ranges that do not contain any specified IP addresses. The IP addresses specified in non-range items and ranges with different IP addresses are ignored. The XC:REMOVEIP command specifies the single IP address as string (for example, '1.2.3.4' or '2001:db8:ce4::42'). The XC:RMEOVERANGE command specifies the set of IP addresses as Rapid7 range. The XC:REMOVENET command specifies the set of IP addresses as network string. If the first argument denotes an incorrect IP address (range or network respectively), the template execution is stopped and an error is generated for DEBUG mode, and nothing happens for non-DEBUG mode.

**Evaluating IP Address in a Range or Network**

Use the XC:IS_IP_IN operation to validate if an IP address is in the range and network. This operation should be specified as follows: ${XC:IS_IP_IN:{"var_with_IP"}::{"var_with_net_or_range"}} where IP address is a string such as '1.2.3.4' or '2001:db8:ce4::42'.

Having the L namespace as:

```json
{
    'ip1': '1.2.3.4',
    'ip2': '2001:db8:ce5::42',
    'range': {
        '<xmla>': True,
        'name': 'range',
        'attrs': {'from': '1.2.0.0', 'to': '1.2.255.255'},
        'value': [],
        'index': {} },
    'net': '2001:db8:ce4::/48'
}
```

The ${XC:IS_IP_IN:{L:ip1}:{L:range}} variable will be evaluated to string as "true".
The ${XC:IS_IP_IN:{L:ip2}:{L:net}} variable will be evaluated to string as "false".

**Creating Keys**

Use the XC:KEYS operation to create keys. This operation should be specified as follows: ${XC:KEYS:{"var_with_dict"}::{"var_for_key_list"}}. It creates a list from the keys of the 'var_with_dict' variable and includes it in the 'var_for_key_list' variable.

Having L namespace as

```json
{
    'some_dict': {
        'key1': 'value',
        'key2': 42,
        'key3': ['item1', 'item2']
    }
}
```

After evaluating the ${XC:KEYS:{L:some_dict}:{L:key_list}} variable, the L namespace will contain new variable key_list with the following values:

```json
[ 'key1',
  'key2',
  'key3'
]
```

**Variable Examples**

The following are variable examples.

**Note:** The XC: examples refer to the operations discussed in the Command Execution section.
### Variables and Results

<table>
<thead>
<tr>
<th>Variable:</th>
<th>Result:</th>
</tr>
</thead>
<tbody>
<tr>
<td>${E::FQDN}</td>
<td>Substitute the FQDN value from the event.</td>
</tr>
<tr>
<td>${I::QUARANTINE}</td>
<td>Substitute the quarantine value from the template instance.</td>
</tr>
<tr>
<td>${XC:COPY:{E:TIMESTAMP}:{L:epoch_timestamp}}${XC:FORMAT:DATE_EPOCH:{L:epoch_timestamp}}</td>
<td>Copy the event TIMESTAMP value into a local epoch_timestamp variable.</td>
</tr>
<tr>
<td>${XC:COPY:{E:TIMESTAMP}:{L:custom_timestamp}}${XC:FORMAT:DATE_STRFTIME:{L:custom_timestamp}:{%a, %d %b %Y %H:%M:%S}}</td>
<td>Copy the event TIMESTAMP value to a local custom_timestamp variable and format it. In this example, the result might be Wed, 18 Jun 2015 16:13:11.</td>
</tr>
<tr>
<td>${XC:INC:{S:SERIAL}}${S::SERIAL}</td>
<td>Increment the state ‘SERIAL’ value and substitute its value</td>
</tr>
<tr>
<td>${XC:COPY:{S:SERIAL}:{H:X-customheader}}</td>
<td>Copy the state SERIAL value to a custom HTTP header for future requests</td>
</tr>
<tr>
<td>${XC:DEL:{H:X-loginvalue}}</td>
<td>Removes the specified HTTP header.</td>
</tr>
<tr>
<td>${XC:DEL:{C:logincookie}}</td>
<td>Removes the specified cookie.</td>
</tr>
<tr>
<td>${XC:ASSIGN:{L:INT}:{I:123}}</td>
<td>Assign the integer 123 to the value INT in the L name space.</td>
</tr>
<tr>
<td>${XC:ASSIGN:{L:BOOL}:{B:true}}</td>
<td>Assign true to the value BOOL in the L name space.</td>
</tr>
<tr>
<td>${XC:ASSIGN:{L:STR}:{S:some } random string}</td>
<td>Assign the string some } random string to the value STR in the L name space.</td>
</tr>
<tr>
<td>${XC:DEBUG:{L:INT}}</td>
<td>Output the value of the L name space INT variable to the debug file.</td>
</tr>
<tr>
<td>${XC:DEBUG:{L:}}</td>
<td>Output the values in the whole L name space to the debug file.</td>
</tr>
<tr>
<td>${XC:FORMAT:TRUNCATE:{L:VAR}:{-1f}}</td>
<td>Truncate L:VAR to the last character.</td>
</tr>
</tbody>
</table>

### Event Variables

The E: event name space is populated with variables from the event. For performance reasons, only the variables referred in the template will be available in the name space. This means that if the template is changed and if a new variable is added, it might take some time for the changes to be propagated to all the Grid members and the new variable to be available in future template executions.

You can use event_type in an action template to specify the following supported event types: RPZ, LEASE, TUNNEL, NETWORK_IPV4, NETWORK_IPV6, RANGE_IPV4, RANGE_IPV6, FIXED_ADDRESS_IPV4, FIXED_ADDRESS_IPV6, HOST_ADDRESS_IPV4, HOST_ADDRESS_IPV6, and SESSION. Note that SESSION is used only for the login and logout events for the session management templates. For information about action templates, see Creating Action Templates; and for information about session management templates, see Creating Session Management Templates.

The following tables list the supported variables by event type:

*Table 45.12 Variables for RPZ Events*
<table>
<thead>
<tr>
<th>NIOS Field Name</th>

<td>From IPv4Address or IPv6Address</td>
<td>List of FQDN</td>
</tr>
</tbody>
</table>

**Enriched from Discovered Data**
| Source IP Attached Device Model | ip.discovered_data.device_model | From discovered data |
| Source IP Attached Device Name | ip.discovered_data.device_port_name | From discovered data |
| Source IP Attached Device Port | ip.discovered_data.device_port_type | From discovered data |
| Source IP Attached Device Type | ip.discovered_data.device_type | From discovered data |
| Source IP Attached Device Vendor | ip.discovered_data.device_vendor | From discovered data |
| Source IP Discovered Name | ip.discovered_data.discovered_name | From discovered data |
| Source IP First Discovered | ip.discovered_data.first_discovered (ISO 8601 format) | From discovered data |
| Source IP Discovered MAC | ip.discovered_data.mac_address | From discovered data |
| Source IP NetBIOS Name | ip.discovered_data.netbios_name | From discovered data |
| Source IP Port Link | ip.discovered_data.port_link_status | From discovered data |
| Source IP Port Speed | ip.discovered_data.port_speed | From discovered data |
| Source IP Port Status | ip.discovered_data.port_status | From discovered data |
| Source IP VLAN Description | ip.discovered_data.port_vlan_description | From discovered data |
| Source IP VLAN Name | ip.discovered_data.port_vlan_name | From discovered data |

**Enriched from Parent Range**

| Source IP Range Start Address | range.start_addr | From parent range |
| Source IP Range End Address | range.end_addr | From parent range |

**Enriched from Parent Network**

| Source IP Network View Name | network.network_view | From parent network |
| Source IP Network | network.network | From parent network |
| Source IP Network Address | network.ipv4addr | From parent network | ip_addr/cidr |
| Example: 1.2.3.4/24 |
| Source IP Network Cidr | network.netmask | From parent network | cidr |
| Source IP Network EA | network.extattrs | From parent network | EA name can be any UTF8 characters. |

**Enriched from Lease Data**

| Source IP Lease Start Time | lease.starts (ISO 8601 format) | From lease data |
### Table 45.13 Variables for DHCP Lease Events

When searching for DHCP lease events with associated discovered data, both the "address" and "hardware" or "duid" must match the discovered data. If there is no hardware or DUID, the lease event cannot be associated with any discovered data.

For leases, same IP addresses may be used by multiple systems, so the IP address must match the MAC address or DUID to ensure that the discovered data has the most likely correct value.

Result Parsing

Besides the R: name space, which is always initialized, if a template step includes the parse setting, then the result returned by the server is interpreted and will be available in the P: name space. Result parsing is extremely naive and supports only the following:

- **JSON**: In this case, the returned JSON will be available in the P name space if it is a dictionary, otherwise it will be as-is in the P:PARSE variable. If JSON is malformed, an error will be logged and P:PARSE will be set to an empty dictionary.

- **REGEX**: The supplied REGEX is applied to the whole body and it will be available in P:PARSE[0] to P:PARSE[N], if you have specified more than one groupings. In this case, P:PARSE[0] contains the full match, and P:PARSE[1..N] contains each individual grouping match. If no groupings are parsed, then P:PARSE will be a string with the matched expression. If one grouping is parsed, then P:PARSE will be a string with the matched grouping result. Note that ^ and $ anchors are the anchors for the whole output to be parsed.

- **RESEXLINE**: The supplied REGEX is applied to every line returned by the server, and each match is assigned to P:PARSE[0] to P:PARSE[N] depending on how many lines match. The REGEX must contain only one grouping. If there are many groupings then the last matched grouping is put in the PARSE value, but if there are no groupings provided then the full match is put in each line. Note that ^ and $ anchors in this case are the anchors for each line.

- **RESEXMULTILINE**: REGEXMULTILINE can be used when multiple groupings are required to be matched in multiple lines. Each match will be in P:PARSE[0..n] and each individual match is a list where the first value is the full REGEX match, and each subsequent value is a grouping match. The first grouping match of the first match can be accessed via ${P:PARSE[0][1]}. Note that ^ and $ anchors in this case are the anchors for each line.

For all REGEX cases, if there are no matches, P:PARSE is set to an empty string.

- **CONDITION**: In some cases, when a condition on a REGEX match is required, it is recommended to use a CONDITION step with the :L (length) format specifier applied to PARSE. So when ${P:L:PARSE} is matched with = 0, it would create a condition evaluating to true if there was a regular expression match.

- **XML**: For XML, the XML data is converted into a dictionary of dictionaries/lists depending on the XML present. Similar to JSON, this will be available in the P name space if it is a dictionary, otherwise it will be as-is in the P:PARSE variable. If the XML is malformed or not parseable, then an error is logged and P:PARSE is set to an empty dictionary.

Parsing does not support DTDs, schemas, or XML attributes. It simply converts the XML document as-is. This also means that if the schema defines a particular element to be a list, it might not be deserialized as a list depending on how many members are present (if there is only one, then the parent is not considered a list.) When serializing XML, any variable composed of a dictionary with an '<xmla>' member set to True will be serialized as an XML element with attributes.

If an XMLA element is serialized under JSON/XML, the attributes will be ignored and the appliance returns a meaningful result (a list of XMLA variables will be serialized in JSON as a list of the values of these elements, assuming the values are simple strings/numbers).

For example, consider the following XML:

```xml
<?xml version="1.0" encoding="UTF-8" ?>
<!DOCTYPE APPLIANCE_LIST_OUTPUT SYSTEM
  "https://qualysapi.qualys.com/api/2.0/fo/appliance/appliance_list_output.dtd">
<APPLIANCE_LIST_OUTPUT>
  <RESPONSE>
    <DATETIME>2014-01-02T09:26:01Z</DATETIME>
    <APPLIANCE_LIST>
      <APPLIANCE>
        <ID>777</ID>
        <NAME>scanner1</NAME>
      </APPLIANCE>
    </APPLIANCE_LIST>
  </RESPONSE>
</APPLIANCE_LIST_OUTPUT>
```
The XML will be deserialized as follows:

```json
{
    "APPLIANCE_LIST_OUTPUT": {
        "RESPONSE": {
            "APPLIANCE_LIST": [
                {
                    "ID": "777",
                    "NAME": "scanner1",
                    "RUNNING_SCAN_COUNT": "0",
                    "S2": "Online",
                    "SOFTWARE_VERSION": "2.6",
                    "STATUS": "Online"
                },
                {
                    "ID": "1127",
                    "NAME": "scanner2",
                    "RUNNING_SCAN_COUNT": "0",
                    "S2": "Online",
                    "SOFTWARE_VERSION": "2.6",
                    "STATUS": "Online"
                },
                {
                    "ID": "1131",
                    "NAME": "scanner3",
                    "RUNNING_SCAN_COUNT": "0",
                    "S2": "Offline",
                    "SOFTWARE_VERSION": "2.6",
                    "STATUS": "Offline"
                }
            ]
        }
    }
}
```
"RUNNING_SCAN_COUNT": "0",
"S2": "Online",
"SOFTWARE_VERSION": "2.6",
"STATUS": "Offline"
},

"DATETIME": "2014-01-02T09:26:01Z",
"LICENSE_INFO": {
    "QVSA_LICENSES_COUNT": "10",
    "QVSA_LICENSES_USED": "3"
}
},

But the following will be deserialized differently:

```
<?xml version="1.0" encoding="UTF-8" ?>
<!DOCTYPE APPLIANCE_LIST_OUTPUT SYSTEM
"https://qualysapi.qualys.com/api/2.0/fo/appliance/appliance_list_output.dtd">
<APPLIANCE_LIST_OUTPUT>
    <RESPONSE>
        <DATETIME>2014-01-02T09:26:01Z</DATETIME>
        <APPLIANCE_LIST>
            <APPLIANCE>
                <ID>777</ID>
                <NAME>scanner1</NAME>
                <SOFTWARE_VERSION>2.6</SOFTWARE_VERSION>
                <RUNNING_SCAN_COUNT>0</RUNNING_SCAN_COUNT>
                <STATUS>Online</STATUS>
            </APPLIANCE>
        </APPLIANCE_LIST>
        
    </RESPONSE>
</APPLIANCE_LIST_OUTPUT>
```

The XML will be deserialized as follows (note the difference in the appliance_list):

```json
{
    "APPLIANCE_LIST_OUTPUT": {
        "RESPONSE": {
            "APPLIANCE_LIST": {
                "APPLIANCE": {
                    "ID": "777",
                    "NAME": "scanner1",
                    "SOFTWARE_VERSION": "2.6",
                    "RUNNING_SCAN_COUNT": "0",
                    "STATUS": "Online"
                }
            }
        }
    }
}
```
XMLA: Infoblox strongly recommends that you use XMLA as the quoting option (as opposed to XML) when you create new action templates. New operations such as PUSH, POP, SHIFT and others are not officially supported for XML parsed data.

XMLA parsing strips all white spaces (horizontal tab, line feed, vertical tab, form feed, carriage return, and space). To keep all white spaces, XMLA_WHITESPACE enum is added. The parsing is the same as XMLA except that there is no white space stripping.

If you set parse to XMLA, the XML parsing supports XML attributes, and the XML document is put in the P:PARSE namespace variable, as illustrated in the following example. This example contains a mixed-attribute XML message with some values that contain attributes and some do not.

```xml
<?xml version="1.0" encoding="utf-8"?>
<SiteConfigResponse success="1">
    <Site id="27" name="SOAPUI13006925d-7dac-428d-aaf1-4038a98838a1" description="" riskfactor="1.0" isDynamic="0">
        <Description/>
        <Hosts a0="123">
            <host a1="123">server1.example.com</host>
            <host>server2.example.com</host>
            <host>server3.example.com</host>
            <host>server4.example.com</host>
            <host>server5.example.com</host>
        </Hosts>
        <Credentials/>
        <Alerting>
            <Alert name="test" enabled="1" maxAlerts="2">
                <scanFilter scanStart="1" scanStop="1" scanFailed="1" scanResumed="1" scanPaused="1"/>
                <vulnFilter severityThreshold="1" confirmed="1" unconfirmed="1" potential="1"/>
                <smtpAlert sender="user1@example.com" server="server6.example.com" limitText="0">
                    <recipient>user2@example.com</recipient>
                </smtpAlert>
            </Alert>
        </Alerting>
        <Schedules></Schedules>
    </Site>
</SiteConfigResponse>
```

The following is the deserialized response in P:PARSE when using XMLA parsing:

```json
[
  {

 },
As shown in the example above, any XML value will become an internal dictionary that contains separate 'attrs' and 'value' members representing the XML attributes (if exist) and the XML values (if exist) of the element respectively, as well as the single "" boolean (set to True) to qualify this particular field as an XML attribute field (this is used when serializing, as well as for user-created XMLA values, see below).

You typically address the XMLA variable by using \( \text{VAR\{tag\{subtag\}} \), which uses the VALUES of the tag (its value or its subtag(s)). To access the attributes of a tag, you use \( \text{VAR\{tag\{attributename\}} \). Example: \( \text{P::PARSE\{SiteConfigResponse\}} \{\{success\}\} \)

If you need to access the name of a tag instead (for example if the remote server can return different tags depending on the status), use the \( \text{[[name]]} \) syntax. For example, you can use \( \text{P::PARSE\{[name]\}} \).

**Adding Outbound Templates**

Before you configure notification rules, you must add or upload outbound templates to the Grid. The appliance uses the scripts in these templates to process and sends outbound notifications to the endpoints. You can either modify existing templates or create new ones through Grid Manager. For information about how to create a template, see [Creating Action Templates](#).

**Note:** When you add an outbound template or make changes to an existing one, it may take a few seconds to a few minutes until the changes are propagated to all the members.

Complete the following to upload an outbound template:

1. From the **Grid** tab, select the **Ecosystem** tab -> **Templates** tab, and then click the Add icon.  
   or  
   From the **Grid** tab, select the **Ecosystem** tab, and click **Add Template** from the Toolbar.
2. In the **Add Template** wizard, complete the following:
   - Click **Select** to upload an outbound template. In the **Upload** dialog box, click **Select** and navigate to the template, and then click **Upload**. Select the **Overwrite the existing template** check box to overwrite an existing template.
3. Click **Add** to add an outbound template.
4. Optionally, click **ViewResults** to open the **Syslog Preview** dialog and view all the syslog messages. For more information, see [Previewing Syslog Events](#).

**Modifying Outbound Templates**

To modify an outbound template:

1. From the **Grid** tab, select the **Ecosystem** tab -> **Templates** tab -> **template** check box, and then click the Edit icon.  
   or  
   From the **Grid** tab, select the **Ecosystem** tab, select the template that you want to modify, click the Action icon and select **Edit**.
2. The `<Template Name>`**Template** editor contains the following tabs from which you can modify information:
   - **General:** You can modify the **Name** and **Comment** fields. All other fields are automatically propagated with available information, such as the template type, vendor type, event type, and action type.
   - **Contents:** This tab displays the content of the uploaded template file. You can modify the template contents and the appliance validates the content for proper JSON format when you save the configuration. For more information about the format of the templates, see [Creating Session Management Templates](#) and [Creating Action Templates](#).
3. Save the configuration.

**Viewing All Outbound Templates**

To view the list of outbound templates:
1. From the Grid tab, select the Ecosystem tab, and then click the Templates tab.

2. Grid Manager displays the following information:
   - **Name**: The outbound template name.
   - **Vendor Type**: The vendor type.
   - **Event Type**: The event type specified in the template.
   - **Template Type**: Displays the template type, such as Session Management or Action template.
   - **Outbound Type**: The endpoint type. This can be REST or DXL.
   - **Comment**: Comments that were entered for the outbound template.
   - **Added On**: Displays the timestamp when the template was uploaded to the Grid Master in this format: YYYY-MM-DD HH:MM:SS, plus time zone.

You can do the following in this tab:

- You can select the Action icon

  ![Action Icon](image)

  and do the following:
  - **Edit**: Select this to modify the outbound template information.
  - **Delete**: Select this to delete a template.
  - **Export**: Select this to export a template.

- Edit the outbound template information.
  - Select the outbound template, and then click the Edit icon.

- Delete an outbound template.
  - Select the template, and then click the Delete icon.

- Export the list of outbound templates.
  - Click the Export icon.

- Print the list of outbound templates.
  - Click the Print icon.

- Use filters and the Go to function to narrow down the list. With the autocomplete feature, you can just enter the first few characters of an object name in the Go to field and select the object from the possible matches.

- Create a quick filter to save frequently used filter criteria:
  
  a. In the filter section, click **Show Filter** and define filter criteria for the quick filter.
  b. Click **Save** and complete the configuration in the Save Quick Filter dialog box.

  The appliance adds the quick filter to the quick filter drop-down list in the panel. Note that global filters are prefixed with [G], local filters with [L], and system filters with [S].

- Sort the outbound templates in ascending or descending order by column.

### Deleting Outbound Templates

You can delete a template anytime after you have created it.

**Note**: Before you delete a template, ensure that it is not in use.

To delete a template:

1. From the Grid tab, select the Ecosystem tab, and then click the Templates tab.
2. Select the template that you want to delete, and click the Delete icon.
3. Click **Yes** in the Delete Confirmation dialog.

### Exporting Template Schema

The Export Template Schema feature allows you to export the session management and action template schema. You can use the exported schema to validate the templates before uploading them. The exported schema is in IETF JSON Schema format. It is a JSON file that is used to define and validate outbound templates you plan to upload to the appliance. If you want to create your own templates, you must follow this schema format. For information about this format, see [https://tools.ietf.org/html/draft-zyp-json-schema-04](https://tools.ietf.org/html/draft-zyp-json-schema-04).

Complete the following to export the outbound template schema:

1. From the Grid tab, select the Ecosystem tab -> select the Templates tab.
2. Expand the Toolbar, click **ExportTemplateSchema** -> select **ActionTemplateSchema** to export the action template schema or select **SessionTemplateSchema** to export the session management template schema.
3. If there is only one template version, the appliance downloads the schema to your local system. If there are multiple template versions, the appliance displays the Export Action Template Schema or Export Session Template Schema dialog. In the dialog, select the template version that you want to export. The template schema is downloaded to your local system.
Configuring Outbound Endpoints

You can configure REST API and DXL endpoints to send outbound notifications.

To configure a REST API endpoint, complete the following:

1. From the Grid tab, select the Ecosystem tab -> Outbound Endpoint tab, and click the Add icon and select REST API Endpoint.
   Or
   From the Grid tab, select the Ecosystem tab -> Outbound Endpoint tab and then click Add -> REST API Endpoint from the Toolbar.
2. In the Add REST API Endpoint wizard, complete the following:
   - URI: Specify the URL for the endpoint to which you are sending the outbound notifications. Example: https://10.36.101.14/offices.
   - Test Connection: Click this to validate the endpoint settings and test the connectivity between the Grid Master and the endpoint (this does not test the connection between the Grid Master Candidate that is assigned as the outbound member and the endpoint), Grid Manager displays a message indicating whether the connection is successful. Note that the test does not validate username, password, or certificate for the endpoint. It only tests the basic connection between the Grid Master and the endpoint.
   - Name: Specify the name used to identify the endpoint.
   - Vendor Type: The REST API vendor type associated with the endpoint. This is optional.
   - Auth Username: Enter the username of the target endpoint. The appliance ignores the Auth Username for WAPI related steps in any action templates if WAPI integration is configured. It still uses this username for other non-WAPI related steps.
   - Auth Password: Enter the user account password for the target endpoint. You can click Clear Password to clear the password and set a new one. The appliance ignores the Auth Username for WAPI related steps in any action templates if WAPI integration is configured. It still uses this password for other non-WAPI related steps.
   - Client Certificate: Click Select to upload the endpoint certificate. In the Upload dialog box, click Select to navigate to the certificate, and then click Upload.
   - WAPI Integration Username: If you have included at least one "wapi" related field in your action template, you must configure WAPI integration; otherwise the WAPI step will fail due to an authorization error. Enter the username of the admin user you want to designate for RESTful API outbound notifications. The appliance ignores the Auth Username and Auth Password for WAPI related steps in any action templates if WAPI integration is configured.
   - WAPI Integration Password: Enter the password of the admin user you have designated for RESTful API outbound notifications.
   - Server Certificate Validation: Select one of the following for server certificate validation:
     - Use CA Certificate Validation (Recommended): Select this to validate the CA certificate for the endpoint. The certificate is used to establish a secure connection to the endpoint before data transmission. Click CA Certificates to upload the trusted CA certificate of the endpoint. In the CA Certificates dialog box, click the Add icon, and then navigate to the certificate to upload it. This is the default.
     - Enable Host Validation: Select this to enable the validation of the hostname for the endpoint, in addition to the CA certificate. If you do not select this, the appliance validates only the CA certificate.
     - Do not use validation (Not recommended): Infoblox does not recommend using this for your production system. Use this for testing purposes only.
   - Member Source outbound API requests from:
     - Selected Grid Master Candidate (Recommended): Select this to use the Grid Master Candidate to process and send outbound notifications to the endpoint. If there are multiple Grid Master candidates, select a Grid Master Candidate from the drop-down list. This is the recommended choice and is selected by default because the CPU and memory required for processing and sending outbound events from the Grid Master Candidate can be offloaded or manually load balanced across multiple Grid Master Candidates if required.

Note: If your outbound member is a Grid Master Candidate and in case the Grid Master Candidate is promoted to the Grid Master, make sure that you modify the outbound member to the Grid Master on the endpoint configuration to avoid any outbound notification failures. For information, see Modifying Outbound Endpoint Configuration.

- Current Grid Master: Click this to use the Grid Master to send outbound notifications to the endpoint. When you use the Grid Master as the outbound member, ensure that it has enough CPU and memory to process all the workloads and processes, in addition to being an outbound member. Infoblox recommends that you use the Grid Master as an outbound member only for testing purposes to avoid overloading the Grid Master and to maintain optimal performance for the Grid.
- Comment: Enter additional information about the REST API endpoint.
- Disable: Select this if you want to save the configuration but do not want to use it yet. You can clear this check box when you are ready to use this configuration.

3. Click Next to set the duration of time that the endpoint waits for a response from the outbound member. Complete the following to specify session timeout value:
   - Timeout: Specify the session timeout value for the endpoint. The default value is 30 seconds.
   - Log Level: From the drop-down list, select the severity level for the events. The severity level you select here determines the type of events that are being logged. This can be Debug, Info, Warning, or Error. When you select Debug, all fields or variables used in the events that were sent to the endpoint are logged, including deduplicated events for RPZ hits. For information about deduplication, see Deduplicating RPZ Events. Note that setting this to Debug might slightly affect the performance of your production system.
   - Template: Click Select Template to select a session management template. For information, see Creating Session Management
I Templates
- **Vendor Type**: Displays the vendor information for the endpoint.
- **Action Type**: Displays Session Management or Action based on the template you select.
- **Parameters**: Displays the parameters of the template you select. You can access these values in the notification rules.

4. Click **Next** to add extensible attributes for the endpoint. For information, see About Extensible Attributes.

5. Save the configuration.

### Configuring DXL Endpoints

When adding a DXL endpoint, you must configure the DXL client and broker. You can manually configure the list of DXL brokers that are used by DXL clients in NIOS or import the broker configuration file, as described in the following steps.

To configure a DXL endpoint, complete the following:

1. From the Grid tab, select the Ecosystem tab -> OutboundEndpoint tab, and click the Add icon and select Add DXL Endpoint.

   Or

   From the Grid tab, select the Ecosystem tab -> OutboundEndpoint tab and then click Add -> Add DXL Endpoint from the Toolbar.

2. In the Add DXL Endpoint wizard, complete the following:
   - **Name**: Specify the name used to identify the endpoint.
   - **Vendor Type**: The DXL vendor type associated with the endpoint. This is optional.
   - **Client Certificate**: Click **Generate** to generate and upload both the client and CA certificates of the endpoint on NIOS. When you click **Generate**, the client certificate is automatically uploaded on NIOS and a copy of CA certificate is downloaded. Import this downloaded CA certificate to the DXL server. For information about how to import the CA certificate, refer to the McAfee documentation. If you already have the client certificate, you can upload it by clicking the Upload icon. Click **Upload** to upload the client certificate. In the Upload dialog box, click Select to navigate to the certificate, and then click Upload.
   - **CA Certificates**: Click **CACertificates** to upload the broker Certificate. Download the broker certificate from the DXL server and upload it to NIOS. In the CA Certificates dialog box, click the Add icon, and then navigate to the certificate to upload it.
   - **WAPI Integration Username**: If you have included at least one “wapi” related field in your action template, you must configure WAPI integration; otherwise, the WAPI step will fail due to an authorization error. Enter the username of the admin user you want to designate for DXL notifications.
   - **WAPI Integration Password**: Enter the password of the admin user you have designated for DXL notifications.
   - **Member Source outbound API requests from**: Select one of the following to process for sending outbound notifications:
     - **Selected GridMaster Candidate (Recommended)**: Select this to use the Grid Master Candidate to process and send outbound notifications to the endpoint. If there are multiple Grid Master candidates, select a Grid Master Candidate from the drop-down list. This is the recommended choice and is selected by default because the CPU and memory required for processing and sending outbound events from the Grid Master Candidate can be offloaded or manually load balanced across multiple Grid Master Candidates if required.
   - **Note**: If your outbound member is a Grid Master Candidate and in case the Grid Master Candidate is promoted to the Grid Master, make sure that you modify the outbound member to the Grid Master on the endpoint configuration to avoid any outbound notification failures. For information, see Modifying Outbound Endpoint Configuration.
     - **Current Grid Master**: Click this to use the Grid Master to send outbound notifications to the endpoint. When you use the Grid Master as the outbound member, ensure that it has enough CPU and memory to process all the workloads and processes, in addition to being an outbound member. Infoblox recommends that you use the Grid Master as an outbound member only for testing purposes to avoid overloading the Grid Master and to maintain optimal performance for the Grid.
     - **Comment**: Enter additional information about the DXL endpoint.
     - **Disable**: Select this if you want to save the configuration but do not want to use it yet. You can clear this check box when you are ready to use this configuration.

3. Click **Next** to add the DXL broker. There are two ways to configure the DXL broker. You can manually enter the host name of the broker or you can import the broker configuration file using the Import option. In the Brokers wizard, do one of the following:
   - **Click Add** to open the Add Broker wizard. Enter the host name in the Host Name text box. Optionally, you can enter the following information as well:
     - **IP address**: Enter the IP address of the DXL broker.
     - **Unique ID**: A unique identifier for the broker. This is useful for identifying the DXL broker in log messages.
     - **Port information**: The port number used to communicate with the DXL broker.
   - **Click Import** to upload the broker configuration file. In the Upload dialog box, click Select to navigate to the certificate, and then click Upload.

   **Note**: You can export the Broker configuration file from McAfee ePolicy Orchestrator (McAfee ePO). For information how to export, refer to the McAfee documentation.

   Click **Test Connection** to validate the connectivity between the DXL broker fabric and the Grid Master.

4. Click **Next** to set the severity level for the events.
• **Log Level**: From the drop-down list, select the severity level for the events. The severity level you select here determines the type of events that are being logged. This can be **Debug**, **Info**, **Warning**, or **Error**. When you select **Debug**, all fields or variables used in the events that were sent to the endpoint are logged, including deduplicated events for RPZ hits. For information about deduplication, see **Deduplicating RPZ Events**. Note that setting this to **Debug** might slightly affect the performance of your production system.

• **Vendor Type**: Displays the vendor information for the endpoint.

• **Template Type**: Displays Session Management.

• **Parameters**: Displays the parameters of the template you select. You can access these values in the notification rules.

5. Click **Next** to add extensible attributes for the endpoint. For information, see **About Extensible Attributes**.

6. Save the configuration.

### Modifying Outbound Endpoint Configuration

To modify an endpoint configuration:

1. From the **Grid** tab, select the **Ecosystem** tab -> **Outbound Endpoint** tab, click the **Action** icon next to the endpoint name and select **Edit** from the menu.

2. The `<Endpoint Name>` **Endpoint** editor provides the following tabs from which you can modify data:
   - **General**: You can modify the general information of an endpoint, as described in **Configuring Outbound Endpoints**.
   - **Brokers**: You can modify the DXL broker configuration, as described in **Configuring DXL Endpoints**. This tab is available only for DXL endpoints.
   - **Session Management**: You can edit the session timeout value and upload a new session management template.
   - **Extensible Attributes**: You can add, modify, and delete extensible attributes that are associated with an endpoint. For information, see **About Extensible Attributes**.

3. Save the configuration.

### Viewing All Outbound Endpoints

The **Outbound Endpoint** tab displays all outbound endpoints that are configured on the NIOS appliance.

To view the list of outbound endpoints:

1. From the **Grid** tab, select the **Ecosystem** tab, and click the **Outbound Endpoint** tab.

2. Grid Manager displays the following information for each endpoint:
   - **Name**: The name of the endpoint.
   - **Endpoint Type**: The endpoint type, such as DXL or REST API.
   - **URI**: The URL to which the outbound notifications are sent.
   - **Vendor**: The vendor type associated with the endpoint.
   - **Outbound Member**: The outbound member that processes and sends outbound notifications. This can be either the Grid Master Candidate or the Grid Master. Infoblox recommends that you select the Grid Master Candidate and this is selected by default.
   - **Comment**: Additional information about the endpoint configuration.
   - **Client Certificate Valid From**: The timestamp when the client certificate for a notification endpoint is created.
   - **Client Certificate Valid To**: The timestamp when the client certificate for a notification endpoint expires.
   - **Disabled**: Indicates whether the endpoint is disabled.
   - **Site**: This is a predefined extensible attribute.

You can also do the following in this tab:

- Click the **Action** icon

  ![Action Icon](image)

  and do the following:

  - **Edit**: Select this to modify the endpoint information.
  - **Delete**: Select this to delete an endpoint.
  - **View Debug Log**: Select this to view debug messages about all events associated with the selected endpoint. Through a separate browser, you can view the debug logs from all Grid members.

  - Edit an outbound endpoint information.
  - Select the `<REST API or DXL>` endpoint, and then click the **Edit** icon.
  - Delete an outbound endpoint.
  - Select the `<REST API or DXL>` endpoint, and then click the **Delete** icon.
  - Export the list of outbound endpoints.
  - Click the **Export** icon.
  - Print the list of outbound endpoints.
  - Click the **Print** icon.

  - Use filters and the **Go to** function to narrow down the list. With the autocomplete feature, you can just enter the first few characters of an object name in the **Go to** field and select the object from the possible matches.

  - Create a quick filter to save frequently used filter criteria:

    - In the filter section, click **Show Filter** and define filter criteria for the quick filter.
b. Click Save and complete the configuration in the Save Quick Filter dialog box.

The appliance adds the quick filter to the quick filter drop-down list in the panel. Note that global filters are prefixed with [G], local filters with [L], and system filters with [S].

- Sort the outbound end points in ascending or descending order by column.

### Configuring Notification Rules

You can configure notification rules after you have uploaded outbound templates and configured outbound endpoints on the NIOS appliance. For information about adding outbound endpoints, see Configuring Outbound Endpoints. To send outbound notifications from NIOS to the target endpoints, you must configure notification rules. When adding rules, you must associate the correct action template to the rule. The appliance validates the event type specified in the template with the event type that you select in the notification rule. The parameters defined in a template decides the way NIOS specific data is presented to an endpoint. Each notification rule specifies the target endpoint, notification rule criteria, and the outbound template being used to take action for the matching events.

**Note:** When you remove all the notification rules associated with an endpoint, all the debug logs for that endpoint will also be removed.

While configuring notification rules, you can decide whether you want to reduce the amount of redundant RPZ hit events or not. Oftentimes, RPZ hits come from the same client IPs, query FQDNs, or networks. To avoid receiving excessive RPZ events at the endpoint, you can configure the appliance to remove or deduplicate subsequent RPZ events (after sending the first event) within a certain time period based on Source IP, Query Name, RPZ Policy, and other related fields. Depending on your configuration, the appliance sends the first RPZ event and deduplicates subsequent events that match your filtering criteria within the configured lookback interval. For more information, see Deduplicating RPZ Events.

### Adding Notification Rules

To add notification rules:

1. From the Grid tab, select the Ecosystem tab -> Notification tab, and then click the Add icon.  
   or  
   From the Grid tab, select the Ecosystem tab, and click Add Notification Rule from the Toolbar.
2. In the Add Notification wizard, complete the following:
   - **Name:** Enter the name of the notification rule.
   - **Target:** Click Select Endpoint to select the endpoint type. If there are multiple endpoints, the All Endpoints Selector dialog box is displayed, from which you can select an endpoint name, such as Cisco ISE.
   - **Target Type:** Displays the target type. You cannot change this.
   - **Comment:** Enter useful information about the notification rule.
   - **Disable:** Select this option to disable the notification rule.
3. Click Next and complete the following to configure notification rules for the selected endpoint:
   - **Event:** Depending on the licenses you have installed in the Grid, you can select the event types you want to apply to the notification rules. The outbound member collects data for the selected events based on your configuration. Note that if there is a significant amount of data or if the network bandwidth is not sufficient, the outbound member might drop some of the events. In this case, you can access the syslog to view the messages related to dropped events. In addition to basic information (such as timestamp, member IP, network, and others), data collected for some event type might include enriched data such as discovered data, parent network information, and associated extensible attributes.

**Note:** The event type you select here will affect the templates that are available when you select the RESTful API template you want to use for the outbound notifications. For example, if you select DNS RPZ as the event type, only templates configured for DNS RPZ event type are available for selection.

From the drop-down list, select the event types you want to monitor for the notification rules:

- **DNS RPZ**: Select this to collect data for RPZ events. The DNS RPZ event type is available only if you have installed the RPZ license in the Grid. When you select this event type, you can enable event deduplication in the next step so the appliance can avoid sending excessive events to the endpoint based on your configuration.
- **DNS Tunneling**: Select this to collect data for DNS tunneling events.
- **DHCP Leases**: Select this to collect data for DHCP leases. Since the same IP addresses might be used by multiple systems, the appliance matches both the IP and the MAC address or the DUID to ensure the discovered data is most likely to be correct.
- **Object Change DHCP Fixed Address IPv4 and IPv6, DB Change DHCP Network IPv4 and IPv6, DB Change DHCP Range IPv4 and IPv6, DB Change DNS Host Address IPv4 and IPv6**: Select any of these to collect data for database changes in fixed addresses, DHCP ranges, networks and DNS host addresses.
- **Action**: This field is displayed only if you have selected Cisco ISE as the endpoint (the Target field). Otherwise, this field is hidden.

In the Match the following rule section, select the filters, operators and values from the drop-down lists for the selected event type. You can use the + icon to construct nested expressions for the rule. Depending on the event type you have selected, you can select the following possible filters:
• DNS RPZ: Action Policy, RPZ Name, RPZ Type, Rule Name, and Source IP
• DNS Tunneling: Source IP
• DHCP Leases: DHCP Fingerprint and Lease State.
• Object Change DHCP Fixed Address IPv4: Disable, IPv4 Address, MAC, Name, Network, and Network View
• Object Change DHCP Fixed Address IPv6: Address Type, Disable, DUID, IPv6 Address, IPv6 Prefix, IPv6 Prefix Bits, Name, Network, and Network View
• DB Change DHCP Network IPv4: Disable, Network, and Network View
• Object Change DHCP Network IPv6: Disable, Network, and Network View
• Object Change DHCP Range IPv4: Disable, Network, Network View, and Server Association Type
• Object Change DHCP Range IPv6: Address Type, Disable, Network, Network View, and Server Association Type
• Object Change DNS Host Address IPv4: Host, IPv4 Address, MAC, Network, and Network View Association Type
• Object Change DNS Host Address IPv6: Address Type, DUID, Host, IPv6 Address, IPv6 Prefix, IPv6 Prefix Bits, and Network View

4. Click Next. If you have selected DNS RPZ as the event type, go to Deduplicating RPZ Events to configure deduplication. Otherwise, go to Selecting Action Template to select an action template.

Deduplicating RPZ Events

1. This step appears only if you have selected DNS RPZ as the event type. To avoid excessive notifications received at the endpoint, complete the following to configure event deduplication:
   • Enable RPZ event deduplication: Select this to enable event deduplication for RPZ hits. When you enable deduplication, the appliance suppress redundant notifications based on your configuration.
   • Log all dropped events due to deduplication to the syslog: Select this if you want to log all the events that have been dropped due to deduplication. Selecting this allows the appliance to record all the dropped events to the syslog.
   • Select the fields to use for deduplication: From the Available table, pick the fields you want to use for filtering the deduplication and move them to the Selected table using the right arrow. You can also deselect any fields by selecting and moving them from the Selected table to the Available table using the left arrow. Event deduplication is done based on the conditions of the selected fields. The following example explains how deduplication works if two RPZ hits occur within the lookback interval, as follows:

   RPZ hit 1: source_ip: 1.2.3.4, query_name: server1.bad.com, rpz_policy: NXDOMAIN, query_type: qname, network.network_view: internal, network.network: 1.2.3.0/24
   RPZ hit 2: source_ip: 1.2.3.4, query_name: www.something.com, rpz_policy: NXDOMAIN, query_type: qname, network.network_view: internal, network.network: 1.2.3.0/24

   If you have selected only Source IP for deduplication, the appliance sends only the first RPZ event to the endpoint. If you have selected both Source IP and Query Name, both PRZ events are sent to the endpoint.

   • Lookback Interval: Enter the time interval during which the appliance evaluates RPZ hit events and stops sending redundant events to the endpoint (based on your configuration). At the end of this interval, the appliance resumes scanning of the client IP, query FQDN, or network for RPZ events. The minimum interval is five seconds and the maximum is 15 minutes. The default is 10 minutes.

2. Click Next to select an action template for the endpoint, as described in Selecting Action Template.

Selecting Action Template

1. In this step, select the outbound template you want to use for outbound notifications. The appliance validates the event type that is added to the notification rule and then matches that with the event type configured in the template.
   In the Template field, click Select Template to associate an action template with the notification rule. If there are multiple templates, the <DXL or RESTful API> Template Selector dialog box is displayed, from which you can select an action template. Note that only templates that have the same event type configured for the notification rule appear in this dialog.
   The following information is displayed about the selected action template:
   • Vendor Type: The vendor type associated with the endpoint.
   • Action Type: The type of action that will be taken for the matching events.
   • Parameters: Displays the associated parameters of the template, such as Name, Value, and Type. You can click the Value cell and modify the value for the parameter.

2. Save the endpoint configuration.

Modifying Notification Rules

To modify a notification rule:

1. From the Grid tab, select the Ecosystem tab -> Notification tab, click the Action icon next to the notification rule and select Edit from the menu.
2. The Notification Rule editor provides the following tabs from which you can modify data:
   • General: You can modify the Target and Comment fields.
**Rules:** You can edit the event type and the rule, as described in [Configuring Notification Rules](#).

**Templates:** You can select a new action template for the notification rule.

3. Save the configuration.

### Viewing All Notification Rules

To view the list of notification rules:

1. From the Grid tab, select the Ecosystem tab, and click the Notification tab.
2. Grid Manager displays the following information:
   - **Name:** Name of the notification rule.
   - **Target:** The target name.
   - **Action:** The action type.
   - **Comment:** Comments that were entered for the notification rule.
   - **Disable:** Displays whether the notification rule is disabled.

You can do the following in this tab:

- Click the Action icon

  and do the following:
  - **Edit:** Select this to modify the notification rule.
  - **Delete:** Select this to delete a notification rule.
  - **Test Rule:** Select this to execute the parameters and fields of a template against the notification criteria and verify whether the notification rule works for the event (specified in the template). Make changes to the template if required, and you can view this information in the debug log.
  - **View Debug Log:** Select this to view debugging messages for the selected notification rule.

- **Edit the notification rule information.**
  - Select the notification rule, and then click the Edit icon.
- **Delete a notification rule.**
  - Select the notification rule, and then click the Delete icon.

**Note:** When you remove all the notification rules associated with an endpoint, all the debug logs for that endpoint will also be removed.

- Print the list of notification rules.
  - Click the Print icon.
- Use filters and the Go to function to narrow down the list. With the autocomplete feature, you can just enter the first few characters of an object name in the Go to field and select the object from the possible matches.
- Create a quick filter to save frequently used filter criteria:
  
  a. In the filter section, click Show Filter and define filter criteria for the quick filter.
  b. Click Save and complete the configuration in the Save Quick Filter dialog box.

The appliance adds the quick filter to the quick filter drop-down list in the panel. Note that global filters are prefixed with [G], local filters with [L], and system filters with [S].

- Sort the notification rules in ascending or descending order by column.

### Sample Templates

This section contains sample templates that illustrate the following:

- Session management using login and logout templates
- Viewing event types
- XML parsing and handling
- Steps execution through backtracking and loops in a template
- Operations using namespace variables
- IP-related XC operations
- WAPI integration

**Note:** Some of the templates are specific for Rapid7 servers.

### Session Management Template

Following is a sample session management template for REST API endpoint:
Note: The login_template and logout_template lines specify the templates to be executed for login and logout. The session_duration line specifies the length of the session. You must upload the login and logout templates before configuring a session management template that refers them.

Following is a sample session management template for DXL endpoint:

```json
{
    "name": "session_template",
    "version": "3.0",
    "type": "DXL_ENDPOINT",
    "vendor_identifier": "DXL",
    "dxl_keep_alive_interval": 60,
    "dxl_topic": "/outbound/session"
}
```

Login Template

```json
{
    "name": "login",
    "version": "2.0",
    "vendor_identifier": "Rapid7",
    "type": "REST_EVENT",
    "event_type": ["SESSION"],
    "content_type": "text/xml",
    "quoting": "XMLA",
    "steps": [
        {
            "body": "${XC:ASSIGN:{H:Authorization}:{S:}}",
            "operation": "NOP",
            "name": "login: clear basic auth"
        },
        {
            "parse": "XMLA",
            "operation": "POST",
            "no_connection_debug": false,
        }
    ]
}
```
"name": "login: request",
"body_list": [
    "<?xml version="1.0" encoding="UTF-8"?>",
    "<LoginRequest user-id="${UT::USERNAME}" password="${UT::PASSWORD}"/>
]
],
{
    "operation": "CONDITION",
    "name": "login: errorcheck",
    "condition": {
        "statements": [],
        "condition_type": "OR",
        "else_eval": "${XC:COPY:{S:SESSID}:{P:PARSE{{session-id}}}}",
        "error": true
    }
}
}

Note: The else_eval line copies the session-id from the parsed reply (if successful); otherwise, it returns an error.

Logout Template

{
    "name": "logout",
    "version": "2.0",
    "type": "REST_EVENT",
    "vendor_identifier": "Rapid7",
    "event_type": ["SESSION"],
    "content_type": "text/xml",
    "quoting": "XMLA",
}
"steps": [
  {
    "parse": "XMLA",
    "operation": "POST",
    "no_connection_debug": false,
    "name": "logout: request",
    "body_list": [
      "<?xml version="1.0" encoding="UTF-8"?>",
      "<LogoutRequest session-id="${S::SESSID}"/>"
    ]
  },
  {
    "operation": "CONDITION",
    "name": "logout: errorcheck",
    "condition": {
      "statements": [
        {
          "op": "!=",
          "right": "${P:A:PARSE[[name]]}",
          "left": "LogoutResponse"
        },
        {
          "op": "!=",
          "right": "1",
          "left": "${P:A:PARSE[[success]]}"  
        }
      ],
      "condition_type": "OR",
      "error": true
    }
  }
]

Action Template

Following is a sample action template for DXL endpoint:

{
  "vendor_identifier": "DXL",
  "version": "3.0",
  "name": "action",
  "type": "DXL_EVENT",
}

```json
"event_type": [ "FIXED_ADDRESS_IPV4" ],
"dxl_topic": "/outbound/action",
"steps": [ 
  { 
    "operation": "DXL_SEND_EVENT",
    "name": "send_ip",
    "body": "address ${E:A:values{ipv4addr}}",
    "dxl_topic": "/outbound/step"
  }
]
}
```

Following is a sample action template for REST API endpoint:

```json
{
  "name": "action",
  "vendor_identifier": "Rapid7",
  "version": "2.0",
  "content_type": "text/xml",
  "action_type": "add network or remove IP",
  "quoting": "XMLA",
  "type": "REST_EVENT",
  "event_type": [ "FIXED_ADDRESS_IPV4", "FIXED_ADDRESS_IPV6" ],
  "steps": [ 
    { 
      "name": "check operation type",
      "operation": "CONDITION",
      "condition": { 
        "statements": [ 
          { 
            "op": "!=",
            "right": "${E:A:operation_type}",
            "left": "INSERT"
          },
          { 
            "op": "!=",
            "right": "${E:A:operation_type}",
            "left": "DELETE"
          }
        ],
        "condition_type": "AND",
        "stop": true
      }
    }
  ]
}
```
{  
  "name": "send SiteListingRequest",
  "operation": "POST",
  "body_list": [
    "<?xml version="1.0" encoding="UTF-8"?>",
    "<SiteListingRequest session-id="${S::SESSID}" />
  ],
  "parse": "XMLA"
},

{  
  "operation": "CONDITION",
  "name": "send SiteListingRequest (error check)",
  "condition": {
    "statements": [
      {
        "op": "!=",
        "right": "${P:A:PARSE[[name]]}",
        "left": "SiteListingResponse"
      },
      {
        "op": "!=",
        "right": "1",
        "left": "${P:A:PARSE{{success}}}"
      }
    ],
    "condition_type": "OR",
    "error": true,
    "else_eval": "${XC:COPY:{L:site_list}:{P:PARSE}"
  }
},

{  
  "operation": "CONDITION",
  "name": "check whether site list is empty",
  "condition": {
    "statements": [{
      "op": "==",
      "right": "${L:L:site_list}",
      "left": "0"
    }],
    "condition_type": "AND",
    "error": false,
    "else_eval": "${XC:COPY:{L:site_list}:${P:PARSE}"
  }  
}
"stop": true
}

{
  "operation": "VARIABLEOP",
  "name": "get the next site",
  "variable_ops": [
  {
    "operation": "POP",
    "type": "COMPOSITE",
    "destination": "L:a_site",
    "source": "L:site_list"
  }
  ],
  "operation": "CONDITION",
  "name": "check site name",
  "condition": {
    "statements": [
      {
        "op": "!=",
        "right": "${L:A:a_site{{name}}}",
        "left": "${E:A:values{extattrs}{r7_site}{value}}"
      }
    ],
    "condition_type": "AND",
    "next": "check whether site list is empty",
    "else_eval": "${XC:COPY:{L:site_id}:{L:a_site{{id}}}"
  }
  ],
  "parse": "XMLA",
  "operation": "POST",
  "name": "send SiteConfigRequest",
  "body_list": [
    "<?xml version="1.0" encoding="UTF-8"?>",
    "<SiteConfigRequest session-id="${S::SESSID}" site-id="${L:A:site_id}"/>
  ]
  }
}

```json
{
    "op": "!=",
    "right": "${P:A:PARSE[[name]]}",
    "left": "SiteConfigResponse"
},
{
    "op": "!=",
    "right": "1",
    "left": "${P:A:PARSE[[success]]}"  
}
],
"condition_type": "OR",
"else_eval": "${XC:COPY:{L:Site}:{P:PARSE{SiteConfigResponse}}}",
"error": true
},
{
    "operation": "CONDITION",
    "name": "check operation type again",
    "condition": {
        "statements": [
            {
                "op": "==",
                "right": "${E:A:operation_type}",
                "left": "INSERT"
            }
        ],
        "condition_type": "AND",
        "eval": "${XC:COPY:{L:network}:{E:values{network}}}${XC:NETWORKTORANGE:{L:network}:{L:range}}",
        "next": "insert network"
    }
}
},
{
    "operation": "CONDITION",
    "name": "remove ip",
    "condition": {
        "statements": [
            {
                "op": "==",
                "right": "${E:A:event_type}",
                "left": "FIXED_ADDRESS_IPV4"
            }
        ],
        "condition_type": "AND",
        "eval": "${XC:COPY:{L:network}:{E:values{network}}}" + ${XC:NETWORKTORANGE:{L:network}:{L:range}}
    }
}
```

{
"op": "!=",
"right": "${E:A:operation_type}"",
"left": "INSERT"
}
],
"condition_type": "AND",
"stop": true
}
],
"operation": "PUT",
"name": "add an attribute with WAPI",
"transport":{"path": "${E:A:values{_ref}}"},
"wapi": "v2.6",
"body": "{"extattrs+": {{r7_added": {"value": "Added to the Rapid7 ${UT:A:TIME}"}}}"
Action Template: Check Operation Type

{
    "name": "check operation type",
    "operation": "CONDITION",
    "condition": {
        "statements": [
            {
                "op": "!=",
                "right": "${E:A:operation_type}",
                "left": "INSERT"
            },
            {
                "op": "!=",
                "right": "${E:A:operation_type}",
                "left": "DELETE"
            }
        ],
        "condition_type": "AND",
        "stop": true
    }
}

Note: The "check operation type" step checks the operation type. If it is neither INSERT nor DELETE, the template execution stops.

Action Template: Get the List of Sites

{
    "name": "send SiteListingRequest",
    "operation": "POST",
    "body_list": [
        "<?xml version="1.0" encoding="UTF-8"?>",
        "<SiteListingRequest session-id="${S::SESSID}" />
    ],
    "parse": "XMLA"
}

{
    "operation": "CONDITION",
    "name": "send SiteListingRequest (error check)",
    "condition": {

"statements": [{
  "op": "!=",
  "right": "${P:A:PARSE[[name]]}",
  "left": "SiteListingResponse"
},
  {  
    "op": "!=",
    "right": "1",
    "left": "${P:A:PARSE[[success]]}"  
  }  
},
"condition_type": "OR",
"error": true,
"else_eval": "${XC:COPY:{L:site_list}:{P:PARSE}"
}
}

Note: The "send SiteListingRequest" and "send SiteListingRequest (error check)
steps request the list of sites on a Rapid7 server. If the response is successful, it copies the list to the L:site_list variable.

Action Template: Locate the Site ID by Name

{  
"operation": "CONDITION",
  "name": "check whether site list is empty",
  "condition": {  
"statements": [{  
"op": "==",
  "right": "${L:L:site_list}",
  "left": "0"
}],  
"condition_type": "AND",
"stop": true
  }
},

{  
"operation": "VARIABLEOP",
  "name": "get the next site",
  "variable_ops": [{  
"operation": "POP",
  "type": "COMPOSITE",
}  
}  
}
"destination": "L:a_site",
"source": "L:site_list"
}
,
{
  "operation": "CONDITION",
  "name": "check site name",
  "condition": {
    "statements": [
      {  
        "op": ">!=",
        "right": "${L:A:a_site{{name}}}",
        "left": "${E:A:values{extattrs}{r7_site}{value}}"
      }
    ],
    "condition_type": "AND",
    "next": "check whether site list is empty",
    "else_eval": "${XC:COPY:{L:site_id}:{L:a_site{{id}}}}"
  }
}
}

NOTES:
- The "check whether site list is empty", "get the next site", and "check site name" steps form a loop for finding the site with specific name in the list of sites.
- The "check whether site list is empty" step checks to see if the list is empty. If it is empty, the site with the specific name is not found and the execution of the template stops.
- In the "get the next site" step, one element is copied to the L:a_site variable.
- In the "check site name" step, the "name" attribute of a site ("${L:A:a_site{{name}}}") is compared to the value of the "r7_site" extensible attribute of the fixed address in ("${E:A:values{extattrs}{r7_site}{value}}"). If they are the same, the site ID is stored to the L:site_id variable ("${XC:COPY:{L:site_id}:{L:a_site{{id}}}}"). If they are not the same, the execution is continued by the "check whether site list is empty" step.

Action Template: Get Site Configuration
{
  "parse": "XMLA",
  "operation": "POST",
  "name": "send SiteConfigRequest",
  "body_list": [
    "<xml version=\"1.0\" encoding=\"UTF-8\"?>",
    "<SiteConfigRequest session-id="${S::SESSID}" site-id="${L:A:site_id}"/>
  ]
},
{
  "operation": "CONDITION",
  "name": "send SiteConfigRequest (error check)",
  "condition": {
    "statements": [
      
    }
}

Copyright ©2019, Infoblox, Inc. All right reserved.
once site-id is known, steps "send SiteConfigRequest" and "send SiteConfigRequest (error check)" request and store the site configuration.

Action Template: Distinguish Between INSERT and DELETE

The "check operation type again" step determines the operation type. If the operation is "INSERT", the network of the inserted fixed address is copied to the L:network variable ${XC:COPY:{L:network}:{E:values{network}}} and transformed to a Rapid7 range to the L:range variable ${XC:NETWORKTORANGE:{L:network}:{L:range}}. After the range is stored, the template execution jumps to the "insert network" step.
Action Template: Delete an IP Address

```json
{
    "operation": "CONDITION",
    "name": "remove ip",
    "condition": {
        "statements": [{
            "op": "==",
            "right": "${E:A:event_type}",
            "left": "\$ FIXED_ADDRESS_IPV4"
        }],
        "condition_type": "AND",
        "eval": "${XC:COPY:{L:ip}:{E:values{ipv4addr}}}${XC:REMOVEIP:{L:ip}:{L:Site{Hosts}}}",
        "else_eval": "${XC:COPY:{L:ip}:{E:values{ipv6addr}}}${XC:REMOVEIP:{L:ip}:{L:Site{Hosts}}}
    }
}
```

**NOTES:**

- If the operation is not "INSERT" (i.e. "DELETE"), the "remove ip" step is executed. The step determines the type of fixed address. The corresponding address \[ {E:values{ipv4addr}} \] or \[ {E:values{ipv6addr}} \] is copied to the \$ip variable, and then the \$ip address is removed from the list of hosts in the site \( ${XC:REMOVEIP:{L:ip}:{L:Site{Hosts}}} \).
- The step "jump to send" skips the "inserting" step and jumps directly to the "send SiteSaveRequest" step.

Action Template: Add an IP Range

```json
{
    "operation": "VARIABLEOP",
    "name": "insert network",
    "variable_ops": [
```
"operation": "PUSH",
"type": "COMPOSITE",
"source": "L:range",
"destination": "L:Site{Site}{Hosts}"
]
}
}

The step "insert network" pushes the L:range to the list of site’s "Hosts".

Action Template: Saving New Configuration

{
  "parse": "XMLA",
  "operation": "POST",
  "name": "send SiteSaveRequest",
  "body_list": [
    "<?xml version="1.0" encoding="UTF-8"?>",
    "<SiteSaveRequest session-id="${S::SESSID}"",
    "${L:x:Site}",
    "</SiteSaveRequest>"
  ],
}

{
  "operation": "CONDITION",
  "name": "send SiteSaveRequest (error check)",
  "condition": {
    "statements": [
      {
        "op": "!=",
        "right": "${P:A:PARSE[[name]]}",
        "left": "SiteSaveResponse"
      },
      {
        "op": "!=",
        "right": "1",
        "left": "${P:A:PARSE{{success}}}"
      }
    ],
    "condition_type": "OR",
    "error": true
  }
}

Note: The "send SiteSaveRequest" and "send SiteSaveRequest (error check)" steps save new site configuration to the Rapid7 server.
Action Template: Add Extensible Attributes Using WAPI

```
{
    "operation": "CONDITION",
    "name": "check operation type once more",
    "condition": {
        "statements": [
            {
                "op": "!=",
                "right": "${E:A:operation_type}",
                "left": "INSERT"
            }
        ],
        "condition_type": "AND",
        "stop": true
    }
},
{
    "operation": "PUT",
    "name": "add an attribute with WAPI",
    "transport": {
        "path": "${E:A:values{_ref}}",
        "wapi": "v2.6",
        "body": "{"extattrs+": {"r7_added": {"value": \"Added to the Rapid7 ${UT:A:TIME}\"}}}"
    }
}
```

**NOTES:**
- The "check operation type once more" step determines the operation type. If the operation is not "INSERT" (i.e. "DELETE"), the template execution stops.
- For the "INSERT" operation, the last step "add an attribute with WAPI" is executed. This step adds an extensible attribute "r7_addded" to the fixed address through RESTful API. The value of the attribute has the current timestamp ($UT:A:TIME$).

Action Template: Add a Host Record

The following sample template, if assigned to a DHCP network notification rule, will insert a host record for any added network that matches the rule, with a hostname and domain name set by extensible attributes in the network. Detailed explanations about this sample are included in **Action Template with Comments: Add a Host Record**.

```
{
    "version": "1.0",
    "name": "Insert host record",
    "comment": "Will automatically insert a host record for new network insertions, assumes the network has a 'Zone' extensible attribute, optionally a 'Hostname' extensible attribute as well",
    "type": "REST_EVENT",
    "event_type": [
        "NETWORK_IPV4"
    ],
    "action_type": "Insert a host record",
    "vendor_identifier": "WAPI 2.3",
}
"transport": { "content_type": "application/json", }, "steps": [ { "name": "stop if it is not a network insert", "operation": "CONDITION", "condition": { "condition_type": "AND", "statements": [ { "left": "${E:A:operation_type}", "op": "!=", "right": "INSERT" } ], "stop": true } }, }, { "name": "stop if we don't have the zone EA set, else save it", "operation": "CONDITION", "condition": { "condition_type": "AND", "statements": [ { "left": "${E:A:values{extattrs}{Zone}{value}}", "op": "==", "right": "" } ], "stop": true, "else_eval": "${XC:COPY:{L:ZONE}:{E:values{extattrs}{Zone}{value}}}" } }, }, { "name": "get the hostname or use a default value", "operation": "CONDITION", "condition": {
"condition_type": "AND",
"statements": [
{
    "left": "${E:A:values{extattrs}{Hostname}{value}}",
    "op": "!=",
    "right": ""
},
"eval": "$\{XC:COPY:{L:HOSTNAME}:{E:values{extattrs}{Hostname}{value}}\}$",
"else_eval": "$\{XC:ASSIGN:{L:HOSTNAME}:{S:defaulthostname}\}$"
},
{
    "name": "insert the host record with the next available IP",
    "operation": "POST",
    "transport": {
        "path": "record:host"
    },
    "body_list": [
        "\{"
        "name": "$\{L:A:HOSTNAME}.\{L:A:ZONE\}\}" ,
        "\"ipv4addrs\": ["func:nextavailableip:${E:A:values{network}}"]",
        "\"comment\": "Inserted via outbound"
    ]
}
]
}

Action Template with Comments: Add a Host Record

The comments (labeled as Note:) embedded in the sample template explain the operation for each section of the template. Note that the execution of this sample template will cause a single POST request to be sent with the following body for an insertion of a 10.0.0.0/24 network with the Zone extensible attribute set to test.com and the Hostname extensible attribute set to name:

```
{"name": "name.test.com","ipv4addrs": ["func:nextavailableip:10.0.0.0/24"],"comment": "Inserted via a template"}
```

**Note:** The preamble of the template specifies the version, version, name and other relevant fields.
network has a 'Zone' extensible attribute, optionally a 'Hostname' extensible attribute as well,
"type": "REST_EVENT",

**Note:** The `event_type` field specifies that this template is used for IPv4 network events only.

"event_type": [
    "NETWORK_IPV4"
],

**Note:** The `action_type` and `vendor_identifier` fields describe the template type and the vendor type.

"action_type": "Insert a host record",
"vendor_identifier": "WAPI 2.3",

**Note:** The following specifies that the template is going to send JSON to the server.

"transport": {
    "content_type": "application/json",
},

**Note:** The following are steps that will be executed sequentially.

"steps": [

**Note:** The first step will stop the execution, without an error, if the network event received is not an insertion – it could be a modify, for example.

    {
        "name": "stop if it is not a network insert",
        "operation": "CONDITION",
        "condition": {

**Note:** You can only one statement: either AND or OR would work.

            "condition_type": "AND",
            "statements": [

**Note:** The match is to check if `operation_type` in the event is different from INSERT. It is a good practice to put the event variable on the left side so if it is not present in the event, the template would not fail.

                {
                    "left": "\${E:A:operation_type}",
                    "op": "!=",
                    "right": "INSERT"
                }
            ],

**Note:** The directive that stops the execution if the condition matches.

            "stop": true
        }
    },
}
Note: The second step will stop the execution if the inserted network does not have the Zone extensible attribute configured. If it has the extensible attribute, it will be put in a temporary local variable for easier access later on.

```json
{
    "name": "stop if we don't have the zone EA set, else save it",
    "operation": "CONDITION",
    "condition": {
        "condition_type": "AND",
        "statements": [
            {
                "left": "${E:A:values{extattrs}{Zone}{value}}",
                "op": "==",
                "right": ""
            }
        ],
        "stop": true,
        "else_eval": "${XC:COPY:{L:ZONE}:{E:values{extattrs}{Zone}{value}}}"
    }
}
```

Note: Similar to the previous section, we have only one statement, so either AND or OR would work. The condition ensures that the Zone extensible attribute is set to a value.

```json

```

Note: As previously mentioned, non-existent variable access in the left side of a condition will not cause an error, but instead return an empty value.

```json
"left": "${E:A:values{extattrs}{Zone}{value}}",
"op": "==",
"right": ""
```

Note: If the extensible attribute is empty or nonexistent, the operation should stop here.

```json
"stop": true,
```

Note: Otherwise, it will copy the zone value to the local ZONE variable.

```json
"else_eval": "${XC:COPY:{L:ZONE}:{E:values{extattrs}{Zone}{value}}}"
```

Note: This step is similar to the zone step above. However, if the host name is not set, it will put a default host name in a local variable to provide the default.

```json
{
    "name": "get the hostname or use a default value",
    "operation": "CONDITION",
    "condition": {
        "condition_type": "AND",
        "statements": [
            {
                "left": "${E:A:values{extattrs}{Hostname}{value}}",
                "op": "!=",
                "right": ""
            }
        ],
        "stop": true,
        "else_eval": "${XC:COPY:{L:ZONE}:{E:values{extattrs}{Zone}{value}}}"
    }
}
```

```json
```

Note: This step is similar to the zone step above. However, if the host name is not set, it will put a default host name in a local variable to provide the default.
"eval": "$\{XC:COPY:{L:HOSTNAME}:{E:values{extattrs}{Hostname}{value}}\}$",

Note: Otherwise, the following is executed if the extensible attribute is empty or not present, by assigning the **defaulthostname** string instead.

"else_eval": "$\{XC:ASSIGN:{L:HOSTNAME}:{S:defaulthostname}\}$"

Note: This step will finally contact the endpoint and in this case insert the host.

```
{
    "name": "insert the host record with the next available IP",
}
```

Note: This defines the HTTP operation to use.

"operation": "POST",

Note: The endpoint is configured starting with **https://master_ip/**. The endpoint template overrides the path with **/wapi/v2.3/** so by default all template requests would go to **https://master_ip/wapi/v2.3/**. In this step, we want to insert a host, so **record:host** is appended to the URI above (no override is set here) to arrive to the valid RESTful URI **https://master_ip/wapi/v2.3/record:host**.

```
"transport": {
    "path": "record:host"
},
```

Note: This is the text that will be sent to the server in the POST’s BODY.

```
"body_list": [
    "\n"name\": \"${L:A:HOSTNAME}.${L:A:ZONE}\",",
    "ipv4addrs": ["func:nextavailableip:${E:A:values{network}}"]],",
```

Note: This option signifies that the RESTful API will use the next available IP in the network as the address for this host.

```
"comment": "Inserted via outbound",
"\n"\n"
```

Note: This chapter provides information about the Infoblox Threat Insight (also referred to as Threat Analytics in Grid Manager), which protects mission-critical DNS infrastructure from data exfiltration through DNS tunneling.
This chapter includes the following sections:

- About Data Exfiltration
- About Infoblox Threat Insight
- About Infoblox Threat Insight
- Guidelines for Using Infoblox Threat Insight
- Supported Appliances for Infoblox Threat Insight
- Configuring Infoblox Threat Insight
- Starting and Stopping the Threat Analytics Service
- Viewing the Analytics Whitelist
- Adding Custom Whitelisted Domains
- Configuring a Local RPZ as the Mitigation Blacklist Feed
- Enabling Threat Insight for the Cloud Client
- Viewing Blacklisted Domains
- Moving Blacklisted Domains to the Whitelist
- Monitoring DNS Tunneling Activities

About Data Exfiltration

The DNS protocol is increasingly used as a pathway for data exfiltration through DNS tunneling attacks. DNS tunneling involves tunneling another protocol through port 53 — often not inspected by firewalls (even the next-generation firewalls) — by malware-infected devices or malicious insiders. There are a number of tools available for tunneling over DNS for a common motivation of bypassing captive portals for paid Wi-Fi access. A free tunneling application released under the ISC license for forwarding IPv4 traffic through DNS servers is one example of the software used in this kind of attack.

As illustrated in Figure 43.1, sensitive information such as credit card numbers and company financial can be stolen either by establishing a DNS tunnel from within the network or by encrypting and embedding chunks of that data in DNS queries. Data is decrypted at the other end and put back together so valuable information can be stolen and misused by malicious attackers.

Figure 43.1 Data Exfiltration

You can use the following features to specifically target DNS tunneling traffic and minimize the risk of DNS data exfiltration:

- Anti-DNS tunneling threat protection rules: These rules detect signature-based payload encoding techniques, such as Base32, Base64 and suspicious label lengths, commonly used by tunneling products such as OzymanDNS, Iodine, DNS2TCP, and SplitBrain. For more information about the threat protection rules, refer to the Threat Protection Rules document available on the Infoblox Support site.
- Infoblox Threat Insight: Infoblox employs streaming analytics to study DNS statistics and create algorithms to identify DNS tunneling traffic. To further defend your system against DNS data exfiltration, Infoblox Threat Insight detects and mitigates DNS tunneling traffic by analyzing DNS queries and responses. Infoblox Threat Insight constantly evaluates incoming DNS traffic and
Following are some guidelines to take into consideration when using Infoblox Threat Insight:

- To start the threat analytics service, you must have at least one RPZ license installed in your Grid (it can be installed on any Grid member) and the Threat Analytics license installed on the Grid member on which you want to start the threat analytics service. To download updates for threat analytics module and whitelist sets, you must have at least one Threat Analytics license installed in the Grid.

- Infoblox recommends that you run the threat analytics service for a limited time to monitor and preview what has been detected before actually blocking blacklisted domains. You can carefully review the list of detected domains and decide which domains you want to continue blocking and which domains you want to add to the analytics whitelist. You should review the blacklisted domains on a regular basis to ensure they are still relevant and the list is not growing due to new threats or changing network environments.

About Infoblox Threat Insight

To mitigate DNS data exfiltration, Infoblox Threat Insight (also referred to as Threat Analytics in the Infoblox GUI or Grid Manager) employs analytics algorithms to detect DNS tunneling traffic by analyzing incoming DNS queries and responses. These algorithms are developed through an extensive study and analysis of sample DNS statistics within which DNS tunneling data is identified by algorithms that cannot be detected by normal rules and signatures. For more information about these analytics, see About Data Exfiltration.

Infoblox Threat Insight identifies data exfiltration tunnels that bypass typical firewall systems. Some popular tunneling tools are OyzmanDNS, SplitBrain, Iodine, DNS2TCP, TCP-Over-DNS, and others. This type of DNS threats are identified as having high activities by using the TXT records in DNS queries. Infoblox Threat Insight also identifies tunnels that are used for C&C. These threats typically do not exhibit high activities or payloads. In general, NXDOMAIN responses fall into this category of threats.

You must have at least one RPZ license installed in your Grid (it can be installed on any Grid member) and the Threat Analytics license installed on the Grid member on which you want to start the threat analytics service. To download updates for threat analytics module and whitelist sets, you must have at least one Threat Analytics license installed in the Grid. When you enable the threat analytics service, NIOS starts analyzing incoming DNS data and applying these algorithms to detect security threats that have the same or similar behavior as the known data. Once security threats are detected, NIOS blacklists the domains and transfers them to the designated mitigation RPZ (Response Policy Zone), and traffic from the offending domains is blocked and no DNS lookups are allowed for these domains from NIOS members on which RPZ are assigned to them. The appliance also sends an SNMP trap each time it detects a new blacklisted domain.

Infoblox Threat Insight also includes a whitelist that contains trusted domains on which NIOS allows DNS traffic. These are known good domains that carry legitimate DNS tunneling traffic such as Avast, Sophos, McAfee, Boingo, Barracuda, and others. The whitelist is extensible so new whitelisted domains can be added and rolled out accordingly.

You can also add custom whitelisted domains or move blacklisted domains to the whitelist. For more information about how to configure Infoblox Threat Insight, see Configuring Infoblox Threat Insight. Before you utilize Infoblox Threat Insight, there are a few guidelines you might need to consider. For more information, see Guidelines for Using Infoblox Threat Insight.

Infoblox Threat Insight came installed with a module set and a whitelist set. To receive subsequent module set and whitelist set updates, you can configure the appliance to automatically download and apply the updates for you, or you can manually upload the updates when the appliance displays a banner message notifying about available updates. For information about how to configure the update policy, see Defining the Threat Analytics Update Policy.

Licensing Requirements and Admin Permissions

You must obtain and install valid licenses on your appliance before using Infoblox Threat Insight. Contact your Infoblox representative to obtain these licenses. For more information, see Managing Licenses.

Infoblox Threat Insight

To start the threat analytics service, you must have at least one RPZ license installed in your Grid (it can be installed on any Grid member) and the Threat Analytics license installed on the Grid member on which you want to start the threat analytics service. To download updates for threat analytics module and whitelist sets, you must have at least one Threat Analytics license installed in the Grid.

Note that running the threat analytics service might affect your system performance if the appliance has a small capacity and is taking on heavy traffic. Evaluate your Grid and Grid members to ensure that you select an appliance that is appropriate for running the threat analytics service. For supported appliances, see Supported Appliances for Infoblox Threat Insight.

Admin Permissions

Superusers can configure all threat protection and analytics related tasks. You can assign Security Permissions to specific admin groups and roles so these users can configure security related tasks. You can also add a global permission for managing Grid security properties or add an object permission for managing member security properties.

To manage the analytics related tasks, you must assign appropriate read-only or read/write Analytics Permissions to the specified admin groups and roles. You can also add the Global Analytics Permission as a global permission or add Member Analytics Permission to specific Grid members as an object permission.

For more information about how to assign admin permissions, see Managing Permissions.
To configure Infoblox Threat Insight, complete the following:

1. Obtain and install valid RPZ and Threat Analytics licenses on the appliance that is used to support analytics. For more information about licenses, see About Infoblox Threat Insight. Note that you must have the threat analytics service running on the member serving recursive DNS queries or have recursive DNS queries forwarded to another DNS server. To generate reports that contain statistics about DNS tunneling, you must also configure a reporting appliance in the Grid.

2. Create and add a new RPZ and use it as the designated mitigation blacklist feed so the appliance can transfer all blacklisted domains to this feed. For more information, see Configuring a Local RPZ as the Mitigation Blacklist Feed. Ensure that you configure an appropriate policy for this RPZ. To monitor the threat analytics service before actually blocking domains, set Policy Override to Log Only (Disabled) . When you are ready to block offending domains, set Policy Override to None (Given).

3. Configure admin permissions so admin users can manage the threat analytics service and analytics related tasks. For information about how to configure admin permission, see Managing Permissions.

4. Start the threat analytics service on the appliance that has the Threat Analytics license installed, as described in Starting and Stopping the Threat Analytics Service.

Note: The analytics functionality only works on recursive servers and forwarding servers that use BIND as the DNS resolver; it does not function on authoritative servers or servers that use Unbound as the DNS resolver.

After you set up Infoblox Threat Insight to mitigate DNS data exfiltration, you can do the following to manage it:

- View supported whitelisted domains for analytics, as described in Viewing the Analytics Whitelist. Note that these domains are specific to analytics only. They are not used in the anti-DNS tunneling threat protection rules.
- Manually add a custom domain to the analytics whitelist, as described in Adding Custom Whitelisted Domains.

Supported Appliances for Infoblox Threat Insight

Due to memory and capacity required to perform analytics, ensure that you install the Threat Analytics and RPZ licenses, and enable the threat analytics service on an appliance that has a big enough capacity. Following are the supported Infoblox appliance models on which you can run the threat analytics service:

- PT-1405, PT-2200, PT-2205, and PT-4000.
- IB-4010, IB-4030 and IB-4030-10GE.
- TE-1415, TE-1425, TE-2210, TE-2215, TE-2220, and TE-2225.
- TE-V1415, TE-V1425, TE-V2210, TE-V2215, TE-V2220, TE-V2225, TE-V4010 and TE-V4015.

Note: Using unsupported appliance models for Infoblox Threat Insight might cause performance issues.

Copyright ©2019, Infoblox, Inc.All right reserved.
• Review the blacklisted domains and make decisions about whether to move them to the analytics whitelist so future DNS activities will not be blocked. For more information, see Viewing Blacklisted Domains.
• Move a blacklisted domain to the analytics whitelist, as described in Moving Blacklisted Domains to the Whitelist.
• Monitor DNS tunneling activities and events using pre-defined reports and the syslog, as described in Monitoring DNS Tunneling Activities.

Starting and Stopping the Threat Analytics Service

To start the threat analytics service, you must have at least one RPZ license installed in your Grid (it can be installed on any Grid member) and the Threat Analytics license installed on the Grid member on which you want to start the threat analytics service. You can also stop the service when necessary.

To start or stop the threat analytics service:

1. From the Grid tab, select the Grid Manager tab -> Services tab, click the Threat Analytics service link. Grid Manager displays only the member or members with the RPZ license installed. Select the member check box.
2. From the Toolbar, click Start to start the service or Stop to stop the service.

When you stop the threat analytics service, the appliance does not detect or protect against non-signature-based DNS tunneling. In addition, reports that you generate might not include statistics related to DNS tunneling.

Note: After you enable the threat analytics service, you must restart DNS service for the analytics to start working.

Viewing the Analytics Whitelist

The Data Management tab -> Threat Analytics tab -> Whitelist tab of Grid Manager lists the trusted domains on which NIOS allows DNS traffic by default. These are known good domains that carry legitimate DNS tunneling traffic such as Avast, Sophos, McAfee, Boingo, Barracuda, and others. They are marked as System domains, and you cannot delete them; but you can disable them so NIOS does not treat them as trusted domains. You can also add custom domains or move blacklisted domains to the analytics whitelist. For more information, see Adding Custom Whitelisted Domains and Moving Blacklisted Domains to the Whitelist.

To view a complete list of trusted domains in the analytics whitelist:

1. From the Data Management tab, select the Threat Analytics tab -> Whitelist tab.
2. The appliance displays the following for each trusted domain:
   • **Actions:** Click the Action icon (shown as a gear in each row) next to a domain and select one of the following:
     • **Disable:** Click this to disable the domain. When you disable a domain, the appliance does not treat this domain as trusted domain until you enable it.
     • **Edit:** Click this to open the Whitelist editor. For system domains, the only property you can modify is to disable or enable them. For custom domains however, you can also add information to the Comment field.
     • **Delete:** This is only applicable to custom domains. You cannot delete system domains. Select this to delete the custom domain.
   • **Domain Name:** The name of the trusted domain.
   • **Type:** Displays the domain type. This can be System or Custom. A system domain is a trusted domain that carries legitimate DNS tunneling traffic such as Avast, Sophos, McAfee, Boingo, Barracuda, and others. A custom domain is one that you have added to the whitelist or moved from the mitigation blacklist RPZ.
   • **Disabled:** Indicates whether this domain is disabled or not. The appliance does not treat disabled domains as trusted domains.
   • **Comment:** Additional information about the domain.

Note: When you upgrade to a future NIOS release or update the analytics whitelist, all changes made to the whitelist will be preserved.

You can also do the following in this panel:

• Click Go to Mitigation Response Policy Zone to access the blacklisted domains that are identified as offenders for DNS tunneling. Blacklisted domains are detected through Infoblox Threat Insight and automatically transferred to the blacklist RPZ feed. For information about these domains, see Viewing Blacklisted Domains.
• Export or import whitelisted domain names using the CSV import and export functionality.
• Navigate to the next or last page of the whitelist using the paging buttons at the bottom of the panel.
• Refresh the analytics whitelist by clicking the Refresh button.
• Use filters and the Go to function to narrow down the list. With the autocomplete feature, you can just enter the first few characters of an object name in the Go to field and select the object from the possible matches.
• Select a quick filter to search for System or Custom whitelist entries, or both.
• Print the whitelist or export it in CSV format.
Adding Custom Whitelisted Domains

The analytics whitelist is populated with trusted domains that carry legitimate DNS tunneling traffic such as Avast, Sophos, McAfee, Boingo, Barracuda, and others. For more information, see Viewing the Analytics Whitelist. You can add domains that you deem trustworthy to this list. When you add a custom domain, it is marked as Custom in the whitelist.

To add a custom whitelisted domain, complete the following:

1. From the Data Management tab, select the Threat Analytics tab -> Whitelist tab, click the Add icon or click Add Custom Whitelist from the Toolbar.
2. In the Add Custom Whitelist wizard, complete the following:
   - **Domain Name**: Enter the name of the domain that you want to add to the analytics whitelist.
   - **Comment**: Enter additional information about this domain.
   - **Disable**: When you select this, the appliance does not treat this domain as a trusted domain. When you enable the domain again, it is considered as a whitelisted domain.
3. Save the configuration. You do not need to restart DNS service to update the analytics whitelist.

Configuring a Local RPZ as the Mitigation Blacklist Feed

For the threat analytics service to function properly and for NIOS to properly report detected backlisted domains, you must create and designate local RPZs as the mitigation for the Grid. You can add any Response Policy Zones to the list of RPZs from different Network and DNS Views. When a domain is detected as malicious, NIOS will update all RPZs in the list. If you assign an existing RPZ that is used for other purposes as the mitigation blacklist feed, you may experience the following:

- Existing RPZ hits are reported as hits detected by the analytics after an upgrade.
- If you manually add rules to the RPZ, all RPZ hits are reported as hits detected by the analytics, regardless of whether they match the manually created rules or are detected through the threat analytics service.

Infoblox recommends that you run the threat analytics service for a limited time to monitor and preview what has been detected before actually blocking domains. To do so, set Policy Override to Log Only (Disabled) when you create the RPZ so you can monitor blacklisted domains without actually blocking them.

**Note**: You can designate only one local RPZ as the Grid-wide mitigation blacklist feed.

To create and designate a local RPZ as the blacklist feed:

1. Create a local RPZ by completing the procedure described in Configuring Local RPZs.

   **Note**: To monitor the threat analytics service without blocking domains, set Policy Override to Log Only (Disabled). When you are ready to block blacklisted domains, set Policy Override to None (Given).

2. From the Data Management tab, select the Threat Analytics tab -> Whitelist tab, click the Grid Threat Analytics Properties from the Toolbar.
3. In the Grid Threat Analytics Properties editor, click the DNS Threat Analytics tab, and complete the following:
   - Click the Add icon to open the Zone Selector dialog box and select the RPZs. You must configure at least one local RPZ. To remove an RPZ, select it from the table and click Delete.
4. Save the configuration.

   **Note**: You cannot delete an RPZ that is used as the mitigation blacklist feed until you remove or clear it from the Grid Threat Analytics Properties editor.

Enabling Client for Threat Insight in the Cloud

If your network configuration includes ActiveTrust Plus or ActiveTrust Advanced Cloud, you can configure a cloud integration client to collect malicious domains detected by the Threat Insight in the cloud. NIOS then applies the detected domains to RPZs that were configured for the on-premises Grid. This feature ensures that all malicious domains detected in the cloud are also captured for on-premises members.

You can use this feature when you have ActiveTrust Plus or ActiveTrust Advanced license. Note that you can configure only one cloud client per on-premises Grid and you must first request an API key through the Cloud Services Portal, so that the cloud client is authorized to retrieve data from Threat Insight in the Cloud.

To configure Threat Insight for the cloud client:

1. From the DataManagement tab, select the DNS tab -> Response Policy Zones tab. Expand the Toolbar and click Threat insight in the Cloud Client.
2. In the Threat insight in the Cloud Client editor, complete the following:
   - **Enable Cloud Client**: Select this check box to enable Threat Insight results in the cloud client.
The Appliance Key: You must request an API key to establish an authorized connection with the cloud client. Click **Request API Key** to request an API key. Do the following in the Request API Key from the **Cloud Services Portal** dialog box:

- **Email:** Enter the email address that is registered in the Infoblox Cloud Services Portal.
- **Password:** Enter the password that is registered in the Infoblox Cloud Services Portal.

An API key is generated in the **API Key** text box only when you enter the correct email address and password. An error message is displayed for an invalid email address and password.

- **Interval:** You can specify how often to request Threat Insight results detected in the cloud client in seconds or minutes. The default is 10 minutes.

- **The list of Response Policy Zones to use for blacklisted domains:** Click the Add icon to add an RPZ to the list. Whenever there are multiple zones, Grid Manager displays the **Zone Selector** dialog box from which you can select one. You can add an RPZs from different network and DNS views. Whenever a new RPZ is added and the cloud client requests data, Grid Manager displays a Warning dialog box to confirm that you wish to request all detected domains by Threat Insight in the cloud client. Even if you have clipped **No** in the **Warning** dialog box, you can use the set cloud_services_portal_force_refresh CLI command in maintenance mode and set the flag to request all domains detected in the cloud client.

3. Click **Save & Close**.

**Viewing Blacklisted Domains**

To review the list of blacklisted domains, complete the following:

1. From the **Data Management** tab, select the **Data Management** tab -> **DNS** tab -> **Response Policy Zones** tab, click the mitigation blacklist RPZ name.
2. Grid Manager displays the following for each blacklisted domain:
   - **Name or Address:** Displays the name or IP address of the blacklisted domain.
   - **Policy:** Displays the policy used to handle the responses when NIOS detected the blacklisted domain.
   - **Data:** Displays the target data about this domain.
   - **Comment:** Displays additional information about this domain.
   - **Site:** This is a pre-defined extensible attributes (if configured) that is used to indicate the location of the domain.
   - **Disable:** Indicates whether this domain is disabled or not. When the domain is disabled, the appliance does not block activities on this domain, and configuration for this domain does not change. When the domain is enabled, it is considered as a blacklisted domain and all DNS activities are blocked.

You can also do the following in the blacklisted domain panel:

- Click **Go to Analytics Whitelist View** to view the analytics whitelist. In the Whitelist panel, you can see all the trusted domains for Infoblox Threat Insight, and DNS activities are allowed on these domains. For more information, see Viewing the Analytics Whitelist.

- If you want to move a blacklisted domain to the analytics whitelist so it becomes a trusted domain, select the domain check box and click the Action icon

  (shown as a gear in each row) next to the domain, and then select **Move to Whitelist**.

  - Navigate to the next or last page of the whitelist using the paging buttons at the bottom of the panel.
  - Refresh the blacklist feed by clicking the Refresh button.
  - Use filters and the **Go to** function to narrow down the list. With the autocomplete feature, you can just enter the first few characters of an object name in the **Go to** field and select the object from the possible matches.
  - Select a quick filter to search for specific entries.
  - Print the blacklist or export it in CSV format.

**Moving Blacklisted Domains to the Whitelist**

When the appliance detects an offending domain for possible DNS tunneling, it responses according to the policy defined in the mitigation blacklist RPZ and adds the domain to the blacklist RPZ feed. You can view all blacklisted domains and turn those you deem trustworthy into trusted domains by moving them to the analytics whitelist. Note that once you move a blacklisted domain to the whitelist, you cannot reverse the action.

To move a blacklisted domain to the analytics whitelist:

1. From the **Data Management** tab, select the **Data Management** tab -> **DNS** tab -> **Response Policy Zones** tab.
2. Select a blacklisted domain and click the Action icon

  (shown as a gear in each row) next to a domain and select **Move to Whitelist**.

The appliance removes the selected domain from the blacklist and adds it to the analytics whitelist. You can click **Go to Analytics Whitelist View** to verify that the domain has been successfully moved.

**Updating Threat Analytics Module and Whitelist Sets**
Infoblox periodically releases threat analytics module and whitelist sets. To ensure that you can import threat analytics updates, you must have at least one Threat Analytics license installed in the Grid. The threat analytics module set consists of the analytics application .jar file, which delivers changes and updates for DNS tunneling detection; and the whitelist set consists of updated trusted domains that carry legitimate DNS tunneling traffic. You can download updates for the module set and whitelist set independently depending on how often Infoblox rolls them out. The appliance displays the version numbers of the module set and whitelist set that your Grid is currently using. To view this information before downloading updates, see Viewing Module and Whitelist Versions.

You can configure the appliance to automatically receive and apply the latest module set and/or whitelist set. When you define an automatic update policy, the appliance checks both the analytics module and whitelist files and automatically downloads the files that have changed. You can also configure a manual update policy in which the appliance notifies you through the message banner when there are updates available. You can then decide whether you want to apply the updates to your Grid or not. For information about how to define the update policy, see Manually Uploading Threat Analytics Updates.

Note: Note that only the Grid Master receives module set and whitelist set updates. Grid member receives these updates through standard Grid replication from the Grid Master. Module and whitelist data is only replicated to Grid members that have the threat analytics service enabled (an RPZ license is required to start this service on the members). The appliance uses the port 443 (HTTPS) for downloading the module set and whitelist data updates.

Infoblox recommends that you configure the appliance to automatically receive module and whitelist updates so your appliance receives the latest information periodically. If you prefer to manually upload updates to your Grid, ensure that you apply them frequently to receive the most updated information.

Viewing Module and Whitelist Versions

1. From the Data Management tab, select the Threat Analytics tab -> Whitelist tab, click the Grid Threat Analytics Properties from the Toolbar.
2. In the Grid Threat Analytics Properties editor, click the Updates tab. This tab displays the following information:
   - Current Whitelist Version: Displays the version number of the threat analytics whitelist set that is currently running on the Grid.
   - Active Module Set Version: Displays the version number of the threat analytics module set that is currently active on the Grid.

Defining the Threat Analytics Update Policy

To configure how you want to obtain the latest threat analytics updates, complete the following:

1. From the Data Management tab, select the Threat Analytics tab -> Whitelist tab, click the Grid Threat Analytics Properties from the Toolbar.
2. In the Grid Threat Analytics Properties editor, click the Updates tab,
3. In the Module Set Updates section, complete the following:
   - Latest Available Module Set: Displays the latest module set that is available for download.
   - Last Checked For Updates: Displays the timestamp when the Grid last checked for updates.
   - Module Set Update Policy: When you select Automatic, the appliance automatically downloads the latest module set and/or whitelist set based on the default or custom schedule. The appliance checks both the module and whitelist files and automatically downloads only the files that have changed. When you select an automatic policy, the threat analytics service on the Grid members is restarted automatically to activate the latest updates. If you select Manual as the update policy, the appliance displays a banner message in Grid Manager to notify you when a new update is available. You must then decide whether to apply the updates to the Grid or not. For information about how to manually apply the updates, see Manually Uploading Threat Analytics Updates.
   - Enable Automatic Module Set Updates: Select this check box to enable the automatic upload feature. When necessary, you can click Download Module Set Now to override the automatic update policy.

In the Schedule section, select one of the following to set up a recurring schedule for automatic downloads:

- **Default**: When you select this, the appliance downloads the updates between 12:00 a.m. and 6:00 a.m. local time based on the time zone configured on your appliance. The appliance automatically selects a time between this time window the first time it performs an automatic update. All subsequent updates then follow the same schedule based on the selected time.
- **Custom**: Select this and click the calendar icon to configure a custom schedule. In the Automatic Module Set Updates Scheduler, you can select Hourly, Daily, Weekly, or Monthly based on how often you want to update the module set and whitelist set.

Note: The scheduled time does not indicate the exact time for the download. Downloads occur during the mid-point during of a 30-minute time frame. Therefore, the actual download can happen 15 minutes before or after the scheduled time.

When you select **Hourly**, complete the following:

- **Schedule every hour(s) at**: Enter the number of hours between each update instance. You can enter a value from 1 to 24.
- **Minutes past the hour**: Enter the number of minutes past the hour. For example, enter 5 if you want to schedule the rule update five minutes after the hour.
- **Time Zone**: Select the time zone for the scheduled time from the drop-down list.

When you select **Daily**, you can select either **Every day** or **Every Weekend** and then complete the following:
1. Time: Enter a time in hh:mm:ss AM/PM (hours:minutes:seconds AM or PM) format. You can also select a time from the drop-down list by clicking the time icon.

2. Time Zone: Select the time zone for the scheduled time from the drop-down list. When you select Weekly, complete the following:

   - Schedule every week on: Select any day of the week.
   - Time: Enter a time in hh:mm:ss AM/PM (hours:minutes:seconds AM or PM) format. You can also select a time from the drop-down list by clicking the time icon.

3. Time Zone: Select the time zone for the scheduled time from the drop-down list. When you select Monthly, complete the following:

   - Schedule the day of the month: Enter the day of the month and the monthly interval. For example, to schedule the rule update on the first day after every 2 months, you can enter Day 1 every 2 month(s).
   - Time: Enter a time in hh:mm:ss AM/PM (hours:minutes:seconds AM or PM) format. You can also select a time from the drop-down list by clicking the time icon.

4. Time Zone: Select the time zone for the scheduled time from the drop-down list.

4. Save the configuration.

Manually Uploading Threat Analytics Updates

When you configure a manual update policy, the appliance notifies you about newly available module set and/or whitelist set updates. You can manually upload the updated files and apply them to the Grid.

To manually upload threat analytics updates:

1. From the Data Management tab, select the Threat Analytics tab -> Whitelist tab, click Updates -> Manual Update from the Toolbar.

2. The Threat Analytics Upload dialog displays the following:

   - Current Whitelist Version: Displays the version of the whitelist set that is currently running on the Grid.
   - Last Applied On: Displays the timestamp and time zone when the last whitelist set was applied to the Grid. This field changes each time when a whitelist set is applied.
   - Latest Available Module Set: Displays the version string of the latest available module set. This field changes each time when the module set is updated.
   - Last Applied On: Displays the timestamp and time zone when the last module set was applied to the Grid. This field changes each time when a module is applied.

To upload the module set or whitelist set:

- File: Click Select to navigate to the file location, and then upload the file. The appliance displays the file name in this field. You can upload either a module set or a whitelist set. Check the current version numbers of the whitelist and module sets to verify if they have changed before uploading new files.

Note: You can only update to a newer whitelist set even though you can switch back to an older version of module set, if any. However, if you have configured an Automatic update policy, the appliance overwrites the older file version with the new one. To avoid this, you can change the update policy to Manual or disable automatic downloads.

Click Test to check the changes that will occur during the update, without actually applying the update. You can view update details in the Syslog Viewer. The appliance preserves the uploaded file if you do not click Update to update the module set or whitelist set. When you manually upload next time, this file name is displayed in the dialog. You can then choose to apply the update from this file or upload a new file before performing the update. Uploading a new file will remove the file that has not been applied.

3. Click Update to update the module set or whitelist set. You can also click View Update Results to view the update results.

Monitoring DNS Tunneling Activities

You can monitor DNS tunneling activities through the following:

- Pre-defined Reports: If you have a reporting appliance configured in the Grid, you can generate the following reports that include DNS tunneling data:
  - DNS Top Tunneling Activity
  - DNS Tunneling Traffic by Category
  - Top Malware and DNS Tunneling Events by Client

- Syslog: All DNS tunneling activities are logged to the syslog. You can view this log to identify specific activities related to DNS tunneling. For more information, see Using a Syslog Server.

Part 9 Reference

This section provides reference information in the following appendices:
The following table provides descriptions of some key terminology used in the Infoblox products. Some terms, such as Grids and high availability, are used in different ways by other networking product vendors. The alphabetically arranged table can help you understand the terms and concepts as Infoblox uses them and as they are used in this guide.

<table>
<thead>
<tr>
<th>Term</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Active Node</td>
<td>The NIOS appliance in an HA (high availability) pair that receives, processes, and responds to all service requests. When an HA failover occurs, the active node becomes the passive node in the HA pair.</td>
</tr>
<tr>
<td>API (Application Programming Interface)</td>
<td>A set of rules and specifications that software programs follow to communicate with each other. It serves as an interface between different software programs and facilitates their interaction. Infoblox provides a Perl API to help facilitate the integration of Infoblox NIOS appliances into network environments. It is an alternate method to the GUI (graphical user interface) in which you use a mouse pointer to click and select options and items to perform tasks.</td>
</tr>
<tr>
<td>Authenticated DHCP</td>
<td>The process of authenticating a network device before a DHCP server assigns a lease. On Infoblox appliances, you can divide a network into segments for unauthenticated, authenticated, and guest users. The Infoblox DHCP server assigns clients to the appropriate segment based on their MAC addresses and authentication credentials.</td>
</tr>
<tr>
<td>BIND (Berkeley Internet Name Domain)</td>
<td>The most commonly used DNS server on the Internet. It allows for a standard way of naming objects and resource records in distributed UNIX environments. It also provides operations for storing and retrieving information about these objects and records.</td>
</tr>
<tr>
<td>bloxSYNC</td>
<td>An Infoblox proprietary mechanism for secure, real-time synchronization of the database that maintains the data, system configuration, and protocol service configuration between the active and passive nodes of an HA pair. With bloxSYNC, the nodes continuously synchronize changes of their configurations and states. When a failover occurs, the passive node can quickly take over services from the active node.</td>
</tr>
<tr>
<td>bloxTools</td>
<td>An Infoblox pre-installed environment that provides tools for creating custom applications that facilitate administrative tasks for an organization.</td>
</tr>
<tr>
<td>Bucket</td>
<td>A bucket contains indexed data.</td>
</tr>
<tr>
<td>Bulk Host</td>
<td>If you need to add a large number of A and PTR records, you can have the NIOS appliance add them as a group and automatically assign host names based on a range of IP addresses and the host name format you specify. Such a group of records is called a bulk host, which the appliance manages and displays as a single bulk host record.</td>
</tr>
<tr>
<td>Captive Portal</td>
<td>An Infoblox service that you enable on Grid members to register users, guest users, or both types of users for authentication purposes on network segments that you define using the authenticated DHCP feature.</td>
</tr>
<tr>
<td><strong>CIDR (Classless Inter-Domain Routing) Notation</strong></td>
<td>A compact specification of an IPv4 or IPv6 address and its associated routing prefix. For example, the CIDR notation of 192.168.100.1/24 represents the IPv4 address of 192.168.100.1 and its routing prefix of 192.168.100.0, or its subnet mask of 255.255.255.0. The CIDR notation of 2001:DB8::/48 represents the IPv6 addresses from 2001:DB8:0:0:0:0:0:0 to 2001:DB8:0:FFFF:FFFF:FFFF:FFFF:FFFF.</td>
</tr>
<tr>
<td><strong>CLI (Command-line Interface)</strong></td>
<td>A way to interact with Infoblox products by typing text-only commands to perform specific tasks.</td>
</tr>
<tr>
<td><strong>Cluster Grouping</strong></td>
<td>Grouping reporting appliances as a disaster recovery measure.</td>
</tr>
<tr>
<td><strong>Dashboard</strong></td>
<td>Your home page on Infoblox Multi-Grid Manager, Grid Manager, and System Manager. It provides easy access to tasks and to the status of your Grids and networks. It also provides various widgets for viewing and managing data.</td>
</tr>
<tr>
<td><strong>DDNS (Dynamic DNS)</strong></td>
<td>The automatic updating of real-time DNS configuration changes and other information on a DNS server when a network device is assigned a new IP address.</td>
</tr>
<tr>
<td><strong>DHCP (Dynamic Host Configuration Protocol)</strong></td>
<td>A configuration protocol that provides address assignments to network devices within a network. It keeps track of network configuration for each network device.</td>
</tr>
<tr>
<td><strong>DHCP Failover Association</strong></td>
<td>The pairing of two DHCP servers that establish a TCP connection for their communications. The servers form a pair of DHCP failover peers and provide DHCP protocol redundancy to minimize DHCP service outages.</td>
</tr>
<tr>
<td><strong>DHCP Filter</strong></td>
<td>A set of criteria and rules used to screen requesting hosts by matching MAC addresses, relay agent identifiers, DHCP options, or RADIUS authentication results.</td>
</tr>
<tr>
<td><strong>DHCP Template</strong></td>
<td>A set of predefined properties that you use to create IPv4 and IPv6 DHCP objects, such as networks and DHCP ranges, on the Infoblox appliance.</td>
</tr>
<tr>
<td><strong>DIW (Data Import Wizard)</strong></td>
<td>An Infoblox software tool that facilitates the import of DNS, DHCP, and TFTP data from legacy servers to Infoblox NIOS appliances. DIW supports DNS data import in the following formats: BIND 9, BIND 8, BIND 4, Microsoft DNS, Lucent VitalQIP, and Nortel NetID. It supports DHCP data import in the following formats: ISC DHCP, Microsoft DHCP, Lucent VitalQIP, and Nortel NetID.</td>
</tr>
<tr>
<td><strong>DNS (Domain Name System)</strong></td>
<td>A hierarchical naming system that translates domain names of any network devices into IP addresses for the purpose of locating and addressing these devices worldwide.</td>
</tr>
<tr>
<td><strong>DNS View</strong></td>
<td>On Infoblox appliances, a DNS view provides the ability to serve one version of DNS data to one set of clients and another version to another set of clients. With DNS views, the Infoblox appliance can provide a different answer to the same DNS query, depending on the source and match destinations of the query.</td>
</tr>
<tr>
<td><strong>DNSSEC (Domain Name System Security Extensions)</strong></td>
<td>A suite of IETF (Internet Engineering Task Force) specifications for securing certain kinds of information provided by DNS for use on IP networks. It is a set of extensions to DNS, which provide DNS resolvers with the original authentication of DNS data, authenticated denial of existence, and data integrity.</td>
</tr>
<tr>
<td><strong>DNSone™</strong></td>
<td>The software package that enables Infoblox appliances to provide DNS, DHCP and TFTP services. You can add the Grid upgrade to Infoblox appliances running DNSone.</td>
</tr>
<tr>
<td><strong>Endpoint</strong></td>
<td>An IP device such as a personal computer, laptop, or mobile handheld device. This term is often used in a security context.</td>
</tr>
<tr>
<td><strong>Extensible Attribute</strong></td>
<td>Metadata you define to capture additional information about an object managed by the Infoblox NIOS appliance. You can use predefined attributes or create your own. You can also specify required attributes and restrict the values that users can enter for each attribute.</td>
</tr>
<tr>
<td>Filters</td>
<td>Criteria the Infoblox NIOS appliance uses to request specific information in the database. You can use filters to control the amount and the kind of data displayed in a panel or table in Infoblox Multi-Grid Manager, Grid Manager, and System Manager.</td>
</tr>
<tr>
<td>-------------------------</td>
<td>--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>FQDN (fully qualified domain name)</td>
<td>A complete domain name that specifies its exact location in the hierarchy of the DNS. It specifies all the domain levels, including the top-level domain and the root domain.</td>
</tr>
<tr>
<td>FTP (File Transfer Protocol)</td>
<td>A standard network protocol used to transfer files from one network device to another over a TCP-based network, such as the Internet. FTP is built on a client-server architecture and utilizes separate control and data connections between the client and server.</td>
</tr>
<tr>
<td>Gateway</td>
<td>The default router for the immediate network segment of an interface.</td>
</tr>
<tr>
<td>Grid™ Technology</td>
<td>Infoblox’s unique and patented high availability Grid technology ensures network reliability. The Infoblox Grid provides resilient network services, failover, recovery, and seamless maintenance for an Infoblox deployment inside a single building, across a networked campus, or between remote locations. The Infoblox Grid establishes a distributed relationship between individual or paired appliances to remove single points of failure and other operational risks inherent in legacy DNS, DHCP, and IP address management infrastructure.</td>
</tr>
<tr>
<td>Grid Manager</td>
<td>The NIOS web interface that provides access to your Grid for performing IPAM, DNS, and DHCP management and other administration tasks.</td>
</tr>
<tr>
<td>Grid Master</td>
<td>The Grid member in an Infoblox Grid that maintains the NIOS database that is distributed among all members of the Grid. You connect to the Grid Master to configure and monitor the entire Grid.</td>
</tr>
<tr>
<td>Grid Member</td>
<td>Any single Infoblox NIOS appliance or HA pair that belongs to a Grid. Each member can use the data and services of the Grid. You can also modify settings so that a Grid member can use unique data and member-specific services.</td>
</tr>
<tr>
<td>HA Pair</td>
<td>Two physical Infoblox NIOS appliances that are linked to perform as a single virtual appliance in an HA (high availability) configuration. The HA configuration provides hardware redundancy to minimize service outages. In this configuration, one appliance is the active node and the other is the passive node.</td>
</tr>
<tr>
<td>Host Record</td>
<td>On Infoblox appliances, host records provide a unique approach that enables you to manage multiple DNS records and DHCP and IPAM data collectively, as one object on the appliance.</td>
</tr>
<tr>
<td>IBOS (Infoblox Orchestration Server)</td>
<td>IBOS is the Infoblox IF-MAP (Interface to Metadata Access Points) server that contains a searchable database for storing state information about network resources. It is the central point with which IF-MAP clients communicate to send and retrieve real-time information defined in the IF-MAP data format.</td>
</tr>
<tr>
<td>IF-MAP (Interface for Metadata Access Points)</td>
<td>An open standard client-server protocol developed by the Trusted Computing Group as one of the core protocols of the TNC (Trusted Network Connect) open architecture. IF-MAP allows network resources to share real-time information.</td>
</tr>
<tr>
<td>IP Map</td>
<td>In Infoblox Grid Manager or System Manager, this is a graphical representation of all IPv4 addresses in a given subnet.</td>
</tr>
<tr>
<td>IPAM (IP Address Management)</td>
<td>Infoblox IPAM provides a means of planning, tracking, and managing IP address space in a network. It glues DNS and DHCP services together so that each service is aware of changes in the other. The Infoblox IPAM implementation offers an IP address-centric approach so you can manage your networks and IP addresses through a centralized GUI.</td>
</tr>
<tr>
<td>Leaf Network</td>
<td>On Infoblox appliances, a network that does not contain any subnets. Lease Logging Member An Infoblox Grid member that is designated to collect DHCP lease events.</td>
</tr>
</tbody>
</table>

Copyright ©2019, Infoblox, Inc. All right reserved.
<table>
<thead>
<tr>
<th>Term</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>License Pool</td>
<td>A license pool is a container associated with the Grid and holds dynamic licenses for a specific feature. Licenses in the pool can be dynamically allocated to and deallocated from Grid members. When not in use, dynamic licenses are released back to the pool for future allocation. There is no expiration for dynamic licenses.</td>
</tr>
<tr>
<td>Limited-Access User</td>
<td>An admin user account that has specific roles and permissions assigned. Limited-access users have restricted access to Infoblox Multi-Grid Manager, Grid Manager, and System Manager, and can only perform certain tasks based on their assigned roles and permissions.</td>
</tr>
<tr>
<td>Lite Upgrade</td>
<td>On Infoblox appliances, a lite upgrade occurs when there are incremental changes to the NIOS software that do not require any change to the database. The appliance can perform a lite upgrade only if the format of the database between the existing NIOS version and the upgrade version is the same. In general, when you upgrade from a major release to a patch release or a patch release to another patch release, you are performing a lite upgrade.</td>
</tr>
<tr>
<td>Loopback Interface</td>
<td>On Infoblox appliances, the virtual network interface on which you can consolidate DNS servers for migration purposes, add anycast addresses to improve the performance of the DNS service, and separate DNS traffic.</td>
</tr>
<tr>
<td>Managing Member</td>
<td>An Infoblox Grid member that is configured to manage Microsoft DNS and DHCP servers.</td>
</tr>
<tr>
<td>Master Candidate</td>
<td>An Infoblox Grid member that is designated to assume the role of the Grid Master as a disaster recovery measure.</td>
</tr>
<tr>
<td>Master Grid</td>
<td>A group of Infoblox appliances that are connected to provide a single point of administration for multiple Grids and network management of these Grids.</td>
</tr>
<tr>
<td>Master Grid Member</td>
<td>Any single Infoblox appliance or HA pair that belongs to the Master Grid. All Master Grid members serve as Master Candidates.</td>
</tr>
<tr>
<td>Multi-Grid Manager</td>
<td>The NIOS web interface that provides access to the Master Grid, from which you can manage multiple Grids and their networks.</td>
</tr>
<tr>
<td>Multi-Grid Master</td>
<td>The Infoblox Master Grid member that maintains the NIOS database that is distributed among all Master Grid members. You connect to Multi-Grid Manager to configure and monitor the Master Grid.</td>
</tr>
<tr>
<td>Multi-Grid Master Candidate</td>
<td>An Infoblox Master Grid member that is designated to assume the role of the Multi-Grid Master as a disaster recovery measure.</td>
</tr>
<tr>
<td>Name Server Group</td>
<td>On Infoblox appliances, a server group that contains one primary DNS server and/or one or more secondary DNS servers. Specifying a single name server group can simplify DNS zone creation.</td>
</tr>
<tr>
<td>NAT (Network Address Translation) Group</td>
<td>A group of Infoblox Grid members that are configured on the same side of a NAT appliance. In a Grid configuration where the Grid Master is configured behind a NAT appliance and there are Grid members on both sides of the NAT appliance, it is necessary to create a NAT group to ensure that the Grid Master and Grid members use the correct NAT and interface addresses for Grid communications.</td>
</tr>
<tr>
<td>Network Block</td>
<td>On Infoblox appliances, an IP address space that is defined in the Master Grid. A network block can consist of other network blocks, network containers, and leaf networks.</td>
</tr>
<tr>
<td>Network Container</td>
<td>On Infoblox appliances, an automatically created container of multiple networks that are subnets of the IP address space configured for the network container. A network container cannot be assigned to a Grid member or be directly created.</td>
</tr>
<tr>
<td>Network Discovery</td>
<td>A set of tools provided by the Infoblox NIOS appliance for detecting active hosts on specified networks and specified VMware vSphere servers.</td>
</tr>
<tr>
<td><strong>Network Map</strong></td>
<td>In Infoblox Grid Manager and System Manager, Network Map presents a complete view of your network space, including the different types of networks that are in it and its unused address space. You can use Network Map to design and plan your network infrastructure, configure and manage individual networks, and evaluate their utilization.</td>
</tr>
<tr>
<td><strong>Network Mask or Netmask</strong></td>
<td>A numeric representation of the bits that are used to split an IP address into the network portion and the host portion. In Infoblox products, this is represented by either quad-dotted decimal representation or CIDR notation for IPv4 network masks, or by CIDR notation for IPv6 network masks.</td>
</tr>
<tr>
<td><strong>Network View</strong></td>
<td>On Infoblox appliances, a single routing domain with its own networks and shared networks. A network view can contain both IPv4 and IPv6 networks. All networks must belong to a network view on the Infoblox appliance.</td>
</tr>
<tr>
<td><strong>NIOS</strong></td>
<td>An Infoblox proprietary system that powers Infoblox solutions with an embedded processor that delivers core network services. It is the operating system that runs on the NIOS appliances—a security-hardened, real-time set of appliances built to ensure the non-stop operation of network infrastructure. NIOS automates the error-prone and time-consuming manual tasks associated with deploying and managing IPAM, DNS, and DHCP required for continuous IP network availability and business uptime.</td>
</tr>
<tr>
<td><strong>NIOS Virtual Appliance</strong></td>
<td>Any Infoblox supported platform, such as the Riverbed Steelhead appliances or VMWare appliances, that runs the vNIOS software. These appliances are also known as the vNIOS appliances.</td>
</tr>
<tr>
<td><strong>Node</strong></td>
<td>A single Infoblox appliance of an HA (high availability) pair. An HA pair consists of an active node and a passive node.</td>
</tr>
<tr>
<td><strong>NTP (Network Time Protocol)</strong></td>
<td>A protocol for synchronizing the clocks of computer systems over packet-switched, variable latency data networks; it essentially keeps network devices on a common clock by resisting the effects of variable latency by means of a jitter buffer.</td>
</tr>
<tr>
<td><strong>Passive Node</strong></td>
<td>The Infoblox NIOS appliance in an HA pair that constantly keeps its database synchronized with that of the active node, so it can take over core network services when an HA failover occurs. When an HA failover occurs, the passive node becomes the active node in the HA pair.</td>
</tr>
<tr>
<td><strong>PortIQ</strong></td>
<td>An Infoblox switch port appliance that enables quick discovery of the Ethernet switch ports. PortIQ identifies ports that are not fully utilized and those that exceed their capacity. You can use PortIQ to troubleshoot LAN environments.</td>
</tr>
<tr>
<td><strong>Quick Filter</strong></td>
<td>A filter that stores specific filter criteria for requesting information displayed in a specific panel in Infoblox Multi-Grid Manager, Grid Manager, and System Manager. For more information, see &quot;Filter.&quot;</td>
</tr>
<tr>
<td><strong>Overlapping Network</strong></td>
<td>On Infoblox appliances, a network that exists in multiple locations, which can be multiple Grids in the Master Grid or within various network views in a Grid.</td>
</tr>
<tr>
<td><strong>Replication</strong></td>
<td>Database distribution among the Infoblox Grid Master and Grid members as well as among the Multi-Grid Master and Master Grid members.</td>
</tr>
<tr>
<td><strong>Replication Factor (Reporting - Multi-Site Cluster)</strong></td>
<td>The number of copies of reporting data in each bucket that the cluster maintains.</td>
</tr>
<tr>
<td><strong>Reservation</strong></td>
<td>On Infoblox appliances, a static IP address that you create for future use. A reservation is a pre-provisioned fixed address. You can reserve this static IP address on the NIOS appliance and assign it to a client in the future.</td>
</tr>
<tr>
<td><strong>Resource Records</strong></td>
<td>A collection of data in the DNS server database. Each resource record specifies information about a DNS object. For example, an A (address mapping) record maps a host name to an IP address, and a PTR (reverse-lookup pointer) record maps an IP address to a host name. The DNS server uses these records to answer queries.</td>
</tr>
<tr>
<td>----------------------</td>
<td>--------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td><strong>Roaming Host</strong></td>
<td>On Infoblox appliances, a host with a dynamically assigned IP address and a specific set of properties and DHCP options. When you create a roaming host for a network device, the device can receive any dynamically assigned address from the network to which it belongs.</td>
</tr>
<tr>
<td><strong>Scope</strong></td>
<td>A DHCP address range on a Microsoft server. Microsoft scope information is converted to equivalent DHCP range information after Microsoft data is synchronized with the NIOS appliance.</td>
</tr>
<tr>
<td><strong>Search Factor</strong></td>
<td>The number of searchable copies of reporting data in each bucket that the cluster maintains.</td>
</tr>
<tr>
<td><strong>Shared Network</strong></td>
<td>On Infoblox appliances, a network segment to which you assign two or more subnets. When subnets in a shared network contain IP addresses that are available for dynamic allocation, the addresses are put into a common pool for allocation when client requests arise.</td>
</tr>
<tr>
<td><strong>Shared Record Group</strong></td>
<td>On Infoblox appliances, a set of resource records that you add to multiple DNS zones. You can create resource records in a group and share the group among multiple zones. The zones handle the shared resource records as any other resource record.</td>
</tr>
<tr>
<td><strong>SSO (Single Sign On)</strong></td>
<td>An Infoblox feature that allows you to automatically sign in to selected Grids from the Master Grid, without having to log in to each individual Grid each time you sign on.</td>
</tr>
<tr>
<td><strong>Smart Folder</strong></td>
<td>On Infoblox appliances, a virtual folder in which you place the results of filter criteria that you select to request specific data in the NIOS database. Once you set up a smart folder, the appliance displays up-to-date information based on your filter and grouping criteria each time you access the folder.</td>
</tr>
<tr>
<td><strong>Subnet (or network)</strong></td>
<td>A logical division of an IP network. A subnet of network may also be called a network. For example, 10.1.0.0/16 is a subnet of 10.0.0.0/8, and fc80:8:8:16::/64 is a subnet of fc80:8:8::/48.</td>
</tr>
<tr>
<td><strong>Superscope</strong></td>
<td>On a Microsoft server, superscope comprises multiple scopes or DHCP address ranges created on a single physical network segment. Microsoft superscope information is converted to equivalent network information after Microsoft data is synchronized with the NIOS appliance.</td>
</tr>
<tr>
<td><strong>Superuser</strong></td>
<td>An admin user account that has unrestricted access to Infoblox Multi-Grid Manager, Grid Manager, or System Manager.</td>
</tr>
<tr>
<td><strong>Support Bundle</strong></td>
<td>A tar.gz file that contains configuration files and system files of the Infoblox NIOS appliance. You can download a support bundle for an independent appliance and for each member in a Grid.</td>
</tr>
<tr>
<td><strong>System Manager</strong></td>
<td>The NIOS web interface that provides access to an independent appliance (single or HA) for performing IPAM, DNS, and DHCP management and other administration tasks.</td>
</tr>
<tr>
<td><strong>TFTP (Trivial File Transfer Protocol)</strong></td>
<td>A data transfer service that provides devices—such as phones, RFID readers, IP cameras, and other devices—with up-to-date software and configuration data.</td>
</tr>
<tr>
<td><strong>Traffic Capture</strong></td>
<td>An Infoblox tools that captures the traffic on one or all of the ports on a NIOS appliance. The NIOS appliance saves all captured traffic in a .cap file and compresses it into a .tar.gz file.</td>
</tr>
<tr>
<td><strong>Upgrade Group</strong></td>
<td>On Infoblox appliances, a group of Grid members that you put together so you can perform software distribution and upgrade at the same time.</td>
</tr>
</tbody>
</table>
VIP (Virtual IP) | On Infoblox appliances, the shared IP address of an HA pair. A VIP address links to the HA port on the active node of an HA pair.
VRID (Virtual Router ID) | VRID identifies the VRRP (Virtual Router Redundancy Protocol) HA pair to which the Infoblox appliance belongs. Through VRID, two HA nodes identify each other as belonging to the same HA pair, and they obtain a virtual MAC address to share with a VIP. A VRID can be any number between 1 and 255, and it must be unique on the local LAN so that it does not conflict with any other Infoblox appliances using VRRP on the same subnet.
vNIOS | The virtual version of NIOS. You can install Infoblox vNIOS software on any supported virtual platform and configure the system as a vNIOS virtual appliance.
VRRP (Virtual Router Redundancy Protocol) | An industry standard MAC address level HA failover mechanism.

Appendix B Grid Manager Icons

This appendix contains the following information about icons used in Grid Manager, System Manager, and Orchestration Server Manager:

- **Icon**: The graphical display of an icon.
- **Icon Name**: The icon name.
- **Description**: The task that Grid Manager performs after you click the icon.
- **Tab/Table/Panel**: Lists the tab, table, or panel in which the icon appears.

The following are common icons that appear in most of the tabs, tables, and panels, and in the Toolbar:

<table>
<thead>
<tr>
<th>Icon</th>
<th>Icon Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><img src="image" alt="Icon" /></td>
<td>Active User</td>
<td>Indicates a user is active on the Microsoft server.</td>
</tr>
<tr>
<td><img src="image" alt="Icon" /></td>
<td>Add</td>
<td>Adds an object</td>
</tr>
<tr>
<td><img src="image" alt="Icon" /></td>
<td>Add Bookmark</td>
<td>Adds a bookmark for an object and displays it in the Bookmarks panel</td>
</tr>
<tr>
<td><img src="image" alt="Icon" /></td>
<td>Arrow (Down)</td>
<td>Moves an object down in a list</td>
</tr>
<tr>
<td><img src="image" alt="Icon" /></td>
<td>Arrow (Up)</td>
<td>Moves an object up in a list</td>
</tr>
<tr>
<td><img src="image" alt="Icon" /></td>
<td>Clear</td>
<td>Clears the status of an object</td>
</tr>
<tr>
<td><img src="image" alt="Icon" /></td>
<td>Clock</td>
<td>Displays a drop-down list for time</td>
</tr>
<tr>
<td><img src="image" alt="Icon" /></td>
<td>Delete</td>
<td>Deletes an object</td>
</tr>
<tr>
<td><img src="image" alt="Icon" /></td>
<td>Disabled</td>
<td>Indicates a disabled object</td>
</tr>
<tr>
<td><img src="image" alt="Icon" /></td>
<td>Download</td>
<td>Downloads a file or data</td>
</tr>
<tr>
<td><img src="image" alt="Icon" /></td>
<td>Edit</td>
<td>Displays the corresponding editor for modifying object configurations</td>
</tr>
<tr>
<td><img src="image" alt="Icon" /></td>
<td>Edit</td>
<td>Displays the corresponding editor for modifying object configurations</td>
</tr>
<tr>
<td>Action</td>
<td>Description</td>
<td></td>
</tr>
<tr>
<td>---------------------</td>
<td>------------------------------------------------------------------</td>
<td></td>
</tr>
<tr>
<td>Execute Now</td>
<td>Executes a scheduled task immediately</td>
<td></td>
</tr>
<tr>
<td>Export</td>
<td>Exports data in the current panel</td>
<td></td>
</tr>
<tr>
<td>Extensible Attribute</td>
<td>Configures extensible attributes for the selected object</td>
<td></td>
</tr>
<tr>
<td>Flat View</td>
<td>Displays a list of objects in a flat view</td>
<td></td>
</tr>
<tr>
<td>Help</td>
<td>Displays information about an object</td>
<td></td>
</tr>
<tr>
<td>Hierarchy</td>
<td>Displays objects in a hierarchical view</td>
<td></td>
</tr>
<tr>
<td>Indexer</td>
<td>Indicates that the reporting member functions as an indexer.</td>
<td></td>
</tr>
<tr>
<td>Import</td>
<td>Imports a file or data</td>
<td></td>
</tr>
<tr>
<td>Import Job Manager</td>
<td>Imports CSV data</td>
<td></td>
</tr>
<tr>
<td>Information</td>
<td>Displays informational data about an object</td>
<td></td>
</tr>
<tr>
<td>Locked</td>
<td>Indicates a locked object</td>
<td></td>
</tr>
<tr>
<td>Microsoft Server</td>
<td>Indicates a Microsoft server</td>
<td></td>
</tr>
<tr>
<td>Pause</td>
<td>Pauses a function</td>
<td></td>
</tr>
<tr>
<td>Print</td>
<td>Prints the information in the current panel</td>
<td></td>
</tr>
<tr>
<td>Restart/Processing</td>
<td>Restarts services on the appliances or indicates a request is in progress</td>
<td></td>
</tr>
<tr>
<td>Refresh</td>
<td>Refreshes the current page or table</td>
<td></td>
</tr>
<tr>
<td>Report</td>
<td>Displays a report, such as the capacity report</td>
<td></td>
</tr>
<tr>
<td>Search</td>
<td>Searches for specific objects</td>
<td></td>
</tr>
<tr>
<td>Search Head</td>
<td>Indicates that the reporting member functions as a search head</td>
<td></td>
</tr>
<tr>
<td>Selected object</td>
<td>Selects an object in a table for a specific function</td>
<td></td>
</tr>
<tr>
<td>Start</td>
<td>Starts a process</td>

Appendix C Guidance Documentation Supplement for Common Criteria

Common Criteria provides an independent and objective evaluation of the security of Information Technology (IT) products. It gives assurance that the product satisfies a set of internationally recognized security standards.

This document provides additional guidance on the secure installation of the Target of Evaluation (TOE) for Common Criteria Evaluation Assurance Level (EAL) 2 Augmented ALC_FLR.2. For more information about the Common Criteria mode, refer to the following:

https://www.commoncriteriaportal.org/
https://www.commoncriteriaportal.org/files/epfiles/Infoblox%20Appliances%20with%20NIOS%20v8.2.6%20ST%20v1.0.pdf
https://www.commoncriteriaportal.org/files/epfiles/Infoblox%20Appliances%20with%20NIOS%20v8.2.6%20ST%20v1.1.pdf

The TOE includes the following Infoblox appliances: IB-825, IB-1425, IB-2225, IB-4015, IB-4025, IB-V825, IB-V1425, IB-V2225, IB-V4015, and IB-V4025 with NIOS version 8.2.6, which are network appliances that provide delivery of IP network services and management, Grid and HA configuration. The TOE is a network device that consolidates the delivery and management of core IP network services including DNS, DHCP, IPAM, FTP, TFTP and HTTP. These appliances can be made compliant with Common Criteria and FIPS 140-2 security standards. When you enable the Common Criteria mode, only the respective mode is enabled in the device. If you enable FIPS mode on the device, it enables both Common Criteria and FIPS modes. For more information about FIPS mode, see Guidance Documentation Supplement for Federal Information Processing Standard.

To ensure that your appliance is Common Criteria compliant, make sure that your hardware and software settings match the evaluated configuration that was certified for Common Criteria.

This document provides clarifications and changes to the Infoblox Administrator Guide and Infoblox CLI Guide, and should be used as the guiding document for installation of the TOE in the Common Criteria evaluated configuration.

This appendix contains the following sections:

- Pre-Requisites
- Verifying the Hardware
- Security Guidelines
- Installation and Configuration
- Administration
  - Setting Password Restrictions for Local Admins
- Enabling/Disabling Common Criteria Mode
  - Using the CLI
- Licenses and Services
- WebUI Settings
  - Creating a Login Banner
  - Modifying the Session Timeout Setting
  - Managing Certificates
- Backing Up and Restoring the Database
- Secure Syslog Transport
- Audit Log
- Syslog

**Pre-Requisites**

Before you begin the configuration, ensure that you have all the necessary components. The following are needed and must be acquired before continuing with this guidance:

1. One of the following supported Infoblox appliance models: IB-825, IB-1425, IB-2225, IB-4015, IB-4025, IB-V825, IB-V1425, IB-V2225, IB-V4015, and IB-V4025 running NIOS version 8.2.
2. A management station or computer from which you configure and manage the NIOS appliance. See Management System Requirements for the system and browser requirements.
Verifying the Hardware

To verify the secure delivery of the hardware:

- Use the tracking number of the order to review the status of the shipment.
- Inspect the tamper-evident seals for any signs of tampering.
- Verify the product by comparing the shipping slip with the invoice.

Security Guidelines

Following are security assumptions to ensure that the TOE is administered in a secure manner after it is delivered:

- The environment ensures the physical security of the TOE, commensurate with its value and the value of the data that it contains.
- Administrators are non-hostile, properly trained and trusted to apply all administrator guidance.
- Administrators will take appropriate measures to prevent unauthorized individuals from accessing the TOE.

Note the following:

- When you configure a Grid Master and enable a certain, either CC or FIPS, mode in the Grid Master and then configure a Grid member with a different mode than that of the Grid Master, the member automatically takes the same mode as the Grid Master when you add this member to the Grid Master. For example, if the Grid Master is in FIPS mode and the Grid member is CC mode enabled, the Grid member becomes FIPS enabled when you add this member to the Grid.
- Consider an HA Grid Master with a certain, either CC or FIPS, mode enabled in the active node. When you join a passive node to the HA Grid Master, it automatically takes the same mode as the Grid Master in the active node. For example, if FIPS is enabled in the active node, then the passive node too becomes FIPS enabled when you join it to the HA Grid Master even though it was in CC mode earlier.
- When the HA pair is enabled, you cannot enable or disable either the CC or FIPS mode on the active or passive nodes.

Infoblox suggests that you do the following for an HA pair:

- Set either CC or FIPS mode on each node before building an HA pair.
- Set both the nodes of an HA pair in the same mode, that is either in the CC mode, or FIPS mode, or none.

Installation and Configuration

To ensure the security of the installation and configuration of the TOE:

- Administrators must install the appliance according to the procedures in the installation guides.
- The TOE contains an option for upgrading the system. This is available only for security administrators. The security administrator will be able to upgrade to a validated release package only. The security administrator can verify the TOE by the version number included in the file name as well as through the administrative interface before and after the upgrade. When upgrading, ensure that the .bin2 file is uploaded, and not the .bin file. Refer to the Release Notes of the NIOS version to which the TOE is upgrading for additional upgrade instructions.
- Users’ access to the TOE is controlled by security mechanisms and unauthorized users are denied access to the TOE. For more information, see Administration.
- The TOE provides external authentication mechanisms for remote users using SSL with Active Directory. For more information, see Authenticating Admins Using Active Directory.

Secure Delivery of NIOS Virtual Software Package

You can download the NIOS virtual software from the Infoblox Technical Support site. To download the software, you must have a valid login account on the Infoblox Support site. Register your product at https://support.infoblox.com if you do not already have an account. This software package consists of a template file with .ova extension for all the supported NIOS appliance models. Make sure that you download the file with an extension that corresponds to the appliance model number. You can deploy the NIOS virtual appliance from a remote web server or a local file system accessible from your management system. To verify the version of the software that you are running, you can use the show version command.

You can validate the file downloaded from the Infoblox support website using the MD5/SHA256/SHA512 checksum provided on the support portal at https://support.infoblox.com. To verify the checksum, you can execute the md5sum/sha256sum/sha512sum command from the Unix/Linux based system or use Cygwin installed on a Windows machine. In addition, there are paid and freeware versions that you can install and execute from Windows. For a Mac OS, you can use the md5/shasum -a 256/shasum -a 512 command. Infoblox recommends that you use what is appropriate for your environment.

The Infoblox appliance ships with a default user name and password. Change the default admin account password immediately after the system is installed to safeguard its use. Make sure that the NIOS appliance has at least one administrator account with superuser privileges at all times, and keep a record of your account information in a safe place. You can create new administrator accounts, with or without superuser privileges. For more information, see Managing Administrators.

The Common Criteria compliant hardware platform that hosts NIOS virtual is VMware ESXi, either version 5.5 or 6.5, with the following system hardware:

- HP DL380 G9 host platform
- Intel Xeon Family processor E5-2680v3 CPU

• 128GB RAM (8 x HP 752369)

Administration

A user must have an admin account to log in to the TOE. Each admin account belongs to an admin group, which contains roles and permissions that determine the tasks a user can perform. The TOE provides a default superuser admin group, called admin-group, with one superuser administrator, admin. The default superuser admin can log in to the TOE, using the default user name admin and password infoblox. Superuser admins are the security admins and have full access and control of all the operations of a TOE. Note that you must change the default user name and password of the default superuser admin to prevent unauthorized access to the TOE. Only superusers can do the following:

• Create admin accounts and groups. For more information, see Chapter 4, Managing Administrators.
• Set password parameters. For more information, see Managing Passwords.
• Create the login banner. For more information, see Creating a Login Banner.
• Set the session timeout. For more information, see Modifying the Session Timeout Setting.
• Manage authentication policy. For more information, see About Remote Admins.
• Manage TOE system time. For more information, see Managing TOE System Time.

Limited-access admin groups provide their members with read-only or read/write access to specific resources such as Grid member, DNS, and DHCP. These admin groups can access the appliance through the remote console, GUI, API, or both. When you provide write access to all Grid members, the TOE allows Grid members to configure audit records to display a detailed or a brief summary. Infoblox recommends that you add only pre-defined roles to the admin groups from the TOE. In addition, limited-access admins are not allowed to perform the following tasks:

• Download the support bundle.
• Enable SNMP on the appliance.
• Upload files that are larger than 100 MB. If the file size is greater than the maximum size allowed, the Upload dialog box closes and an error message is displayed in the feedback panel. The attempt to upload a file that exceeded the maximum will be logged to syslog. Non-superusers only are able to upload files for file distribution and do CSV import.
• Manage audit configuration.

Setting Password Restrictions for Local Admins

All admins are required to enter a username and password when they log in to Grid Manager or the CLI. The password is always obscured when an admin logs in. The TOE defaults to locking out the user after three consecutive failed logins. A superuser must define a password policy that is consistent with the security policy of the organization. The password policy specifies the minimum password length and character types, such as lowercase or uppercase characters, that are allowed in the password. In addition, the policy specifies the number of required character changes from the previous password, whether passwords expire and their duration. Additionally, you can require admins to change their passwords when they first log in or after their passwords are reset. For information about defining the password policy, see Managing Passwords. Local admins must change their passwords according to the defined password policy. A password can be changed as follows:

• By the local admin in the User Profile page. For more information, see Changing the Password and Email Address.
• By the local admin when a password expires or when the admin first logs in. Note that this applies to logging in to the CLI or WebUI.
• By a superuser admin.

Managing TOE System Time

You can manually set the date and time for a TOE or enable NTP. You cannot manually configure the date and time when NTP service is enabled. Changing the date and time resets the application and terminates the management session. For information about setting the system time, see Managing Time Settings.

Enabling / Disabling Common Criteria Mode

**Note:** Infoblox recommends that you do not change the Common Criteria setting of a NIOS appliance that is in a production environment.

Before you enable Common Criteria mode, you must reset a NIOS appliance to its original factory settings. This removes the database, network settings, logs, and configuration files. Then, it reboots with its factory settings, which are the default user name and password, and default network settings. If you do not reset the appliance to its original factory settings, the appliance will not be Common Criteria compliant, even if you enable Common Criteria mode.

To reset the NIOS appliance to its factory settings:
1. Log in to the Infoblox CLI using a superuser account.
2. Enter the following CLI command:

   ```
   reset all
   ```

You can enable and disable Common Criteria mode from the Infoblox CLI only. Do the following to set Common Criteria mode on the appliance:

1. Log in to the Infoblox CLI. After executing the `reset all` command, you can log in to the TOE only by using the default superuser admin name admin and password infoblox.
2. Type the following command:

   `set cc_mode`

For more information about the commands mentioned above, refer to the *Infoblox CLI Guide*. The TOE reboots and goes through boot time self tests. If the test fails, the TOE goes into a loop and displays an error message on the serial console and the LCD. Otherwise, it displays the Login prompt after the self tests.

**Note:** You cannot enable the Common Criteria mode when the FIPS mode is enabled, but note that Common Criteria mode is a subset of the FIPS mode. When you enable FIPS mode in your device, it enables both FIPS and Common Criteria mode. For more information about the FIPS mode, see Appendix D Guidance Documentation Supplement for Federal Information Processing Standard.

To clear Common Criteria mode on an appliance, log in to the Infoblox CLI and execute the command: `reset all`.

### Using the CLI

Only superusers can access the CLI. You can access the CLI through a direct console or using the SSH command in Common Criteria or FIPS mode and also activate the option *Enable Remote Console Access* in the Grid or Member Properties editor.

To access the Infoblox CLI through the console port:

1. Connect a serial cable from the console port on your management system to the console port on the appliance. The appliance has a male DB-9 console port on its front panel.
2. Use the following connection settings to launch an emulation session through a serial terminal emulation program such as Hilgraeve Hyperterminal® (provided with the Windows® operating systems):
   - Bits per second: 9600
   - Data bits: 8
   - Parity: None
   - Stop bits: 1
   - Flow control: Xon/Xoff
3. Use the following default user name and password to log in to the Infoblox appliance:
   
   ```
   admin
   infoblox
   ```

   **Note:** After you log in, change the default user name and password of the default superuser admin to prevent unauthorized access to the TOE. For more information on changing passwords, see *Changing the Password and Email Address*. You can remotely (SSH) log in to the Grid Master candidate and execute the commands.

For more information about the Infoblox CLI, refer to the *Infoblox CLI Guide*.

### Licenses and Services

The TOE does not have general computing capabilities, other than the services required for the operation, administration and support of the TOE. In the evaluated configuration, the TOE has only the following licenses installed: NIOS, Grid, DNS, DHCP, Microsoft Management, DNS Cache Acceleration, Multi-Grid Management, Remote authentication using RADIUS and TACACS+, and Query Redirection. It also supports HSM (Hardware Security Module) Signing, and Remote Console Access. For more information about licenses, see *Managing Licenses*. You can access the remote console using the SSH command. Infoblox also supports SNMPv3 in the Common Criteria mode. The following services are disabled by default in the Common Criteria evaluated configuration and no claims are made regarding their function:

- `bloxTools`
- `Support access`

Installing additional licenses or enabling any of the listed services may result in a non-compliant system.

### WebUI Settings

This section describes the properties that you can set to ensure the security of the Grid Manager web interface.

#### Creating a Login Banner

Before establishing a user session via the WebUI, the TOE displays an initial banner regarding unauthorized use. The message is displayed before the session is established. You can change this message to your organization’s specific advisory notice and warning message regarding unauthorized use of the system. For information about defining the login banner, see *Creating a Login Banner*.

#### Modifying the Session Timeout Setting

You can set the length of idle time before an administrative session to the WebUI times out. The default timeout value is 600 seconds (10 minutes). If an admin does not interact with the application for the specified time, the TOE displays a message that a timeout has occurred. The
admin is then required to log back in to Grid Manager. For information about setting the session timeout, see \textit{Modifying the Session Timeout Setting}.

\section*{Managing Certificates}

The TOE generates a self-signed certificate when it first starts. Because the default certificate is self-signed, your browser does not have a trusted CA certificate or a cached NIOS appliance server certificate (saved from an earlier connection) to authenticate the NIOS appliance certificate. Also, the hostname in the default certificate is www.infoblox.com, which is unlikely to match the hostname of your NIOS appliance. Consequently, a message appears warning that the certificate is not from a trusted certifying authority and that the hostname on the certificate is either invalid or does not match the name of the site that sent the certificate. To eliminate certificate warnings, you can replace the default self-signed certificate with a different certificate.

After the initial login, you can do one of the following:

\begin{itemize}
  \item Generate another self-signed certificate with the correct hostname and save it to the certificate store of your browser.
  \item Request a CA-signed certificate with the correct hostname by generating a Certificate Signing Request (CSR) and sending it to your trusted Certificate Authority (CA). Then when you receive the certificate from the CA, import it to the appliance.
\end{itemize}

For information about these tasks, see \textit{Managing Certificates}.

For Common Criteria compliance, superusers must not use CSRs or certificates with keys smaller than 2048 bits. Limited access users are not allowed to upload a certificate with a key that is smaller than 2048 bits, or create a certificate signing request or self-signed certificate with a key size that is smaller than 2048 bits.

\section*{Backing Up and Restoring the Database}

You must log in with a superuser account to back up files. The administrator must back up system files to the local appliance. You can restore a backup file to an appliance running the same NIOS version as that of the appliance from which the backup file originates. You can also restore a backup file from an appliance running a NIOS version to an appliance running a later NIOS version as long as the upgrade from the earlier NIOS version to the later version is supported. Note that if you need to restore a backup file to an appliance, ensure that the backup file that you are restoring is from an appliance that was Common Criteria compliant as well.

For more information about backing up and restoring the database, see \textit{Backing Up and Restoring Configuration Files}.

\section*{Secure Syslog Transport}

The TOE provides the secure syslog transport feature using the TLS protocol. This allows secure transmission of messages between the syslog client, i.e. your NIOS appliance, and an external syslog server. You must use this feature to be Common Criteria compliant. To ensure secure syslog transport, you add a trusted CA certificate of the server to your NIOS appliance. The certificate is then used to establish a secure connection to the server before transmitting data. For more information, see \textit{Specifying Syslog Servers}.

\section*{SSL and TLS Protocols}

You can enable SSL and TLS protocols in CC mode using the following commands:

\begin{itemize}
  \item \texttt{set ssl_tls_settings}: Use this command to override or restore the default SSL/TLS settings.
  \item \texttt{set ssl_tls_protocols}: Use this command to enable or disable the SSL/TLS protocols.
  \item \texttt{set ssl_tls_ciphers}: Use this command to enable or disable the SSL/TLS cipher suites.
\end{itemize}

For more information about the SSL/TLS protocols, see \textit{SSL and TLS Protocols}. For more information about the list of commands related to SSL/TLS protocols and ciphers, refer to the \textit{Infoblox CLI Guide}.

The commands listed below display the default settings of SSL/TLS protocols in CC mode:

\begin{verbatim}
Infoblox > show ssl_tls_protocols
TLSv1.0  TLSv1.1  TLSv1.2
Infoblox > show ssl_tls_ciphers
TLS_DHE_RSA_WITH_AES_128_CBC_SHA enabled
TLS_DHE_RSA_WITH_AES_256_CBC_SHA enabled
TLS_RSA_WITH_AES_128_CBC_SHA enabled
TLS_RSA_WITH_AES_256_CBC_SHA enabled
\end{verbatim}

The commands listed below display the default settings of SSL/TLS protocols in normal mode:

\begin{verbatim}
Infoblox > show ssl_tls_protocols
TLSv1.0  TLSv1.1  TLSv1.2
Infoblox > show ssl_tls_ciphers
\end{verbatim}
TLS_DHE_RSA_WITH_AES_128_GCM_SHA256 enabled
TLS_DHE_RSA_WITH_AES_256_GCM_SHA384 enabled
TLS_DHE_RSA_WITH_AES_128_CBC_SHA enabled
TLS_DHE_RSA_WITH_AES_256_CBC_SHA enabled
TLS_DHE_RSA_WITH_AES_128_CBC_SHA256 enabled
TLS_DHE_RSA_WITH_AES_256_CBC_SHA256 enabled
TLS_RSA_WITH_AES_128_GCM_SHA256 enabled
TLS_RSA_WITH_AES_128_CBC_SHA enabled
TLS_RSA_WITH_AES_256_CBC_SHA enabled
TLS_RSA_WITH_3DES_EDE_CBC_SHA enabled
TLS_RSA_WITH_AES_256_GCM_SHA384 enabled
TLS_RSA_WITH_AES_256_CBC_SHA enabled
TLS_RSA_WITH_AES_256_CBC_SHA256 enabled
TLS_DHE_DSS_WITH_AES_256_CBC_SHA disabled
TLS_DH_RSA_WITH_3DES_EDE_CBC_SHA disabled
TLS_DH_DSS_WITH_3DES_EDE_CBC_SHA disabled
TLS_DHE_DSS_WITH_AES_128_CBC_SHA disabled
TLS_RSA_WITH_RC4_128_SHA disabled
TLS_DHE_DSS_WITH_AES_256_GCM_SHA384 disabled
TLS_DHE_DSS_WITH_AES_256_CBC_SHA256 disabled
TLS_DHE_DSS_WITH_AES_128_GCM_SHA256 disabled
TLS_DHE_DSS_WITH_AES_128_CBC_SHA256 disabled

Audit Log

The audit log contains a record of all TOE administrative activities. The stored audit records in the audit trail are protected from unauthorized modifications and deletion. For more information about the audit log, see Using the Audit Log. Note that the detailed and brief log types do not depend on the CC mode.

Following are the events that are logged and examples of their corresponding audit log messages:

Identification and Authentication

Event: Enable FIPS mode.
Message: 2011-10-19 19:48:37.299Z [admin]: Login_Allowed - - to=Serial/040Console apparently_via=Direct auth=Local group=.admin-group

Event: Disable FIPS mode.
Message: 2011-10-19 19:48:37.299Z [admin]: Login_Allowed - - to=Serial/040Console apparently_via=Direct auth=Local group=.admin-group

Event: Invalid password when logging in to the WebUI.
Message: 2011-10-19 14:02:32.750Z [admin]: Login_Denied - - to=Serial/040Console apparently_via=Direct error=invalid_login_or_password

Event: Number of attempts exceeds the limit when logging in to the WebUI.
Invalid password when logging in to the CLI.

**Event:** 2011-10-19 14:02:32.750Z [admin]: Login_Denied - - to=Serial\040Console apparently_via=Directerror=invalid\040login\040or\040password

Number of attempts exceeds the limit when logging in to the CLI.

**Event:** 2011-10-19 14:05:23.217Z [admin]: Login_Denied - - to=Serial\040Console apparently_via=Directerror=failed\040logins\040exceed\040limit

Enable Common Criteria mode

**Event:** 2011-10-19 19:48:37.299Z [admin]: Login_Allowed - - to=Serial\040Console apparently_via=Directauth=Local group=.admin-group

**Message:** 2011-10-19 19:48:48.705Z [admin]: Called - set_cc_mode: Args cc_mode_enabled="true"

Disable Common Criteria mode:

**Event:** 2011-10-19 19:48:37.299Z [admin]: Login_Allowed - - to=Serial\040Console apparently_via=Directauth=Local group=.admin-group

**Message:** 2011-10-19 19:48:48.705Z [admin]: Called - set_cc_mode: Args cc_mode_enabled="false"

Login successful

**Event:** 2011-10-19 19:48:48.706Z [USER\040admin]: rebooted the system

GSS-TSIG
Appendix D Guidance Documentation Supplement for Federal Information Processing Standard

The FIPS (Federal Information Processing Standard) 140-2 is a computer security standard that defines a set of rules and regulations to validate cryptographic modules. It gives assurance that the product satisfies a set of internationally recognized security standards.

This document provides additional guidance on the secure installation of the Target of Evaluation (TOE) for FIPS. The TOE includes the following Infoblox appliances that are network appliances and provides delivery of IP network services and management, Grid and HA configuration:

- Virtual appliances (certificate number 3330),
- Trinzic physical appliances: TE-825, TE-1425, TE-2225, TE-4015,
- TE-4025 DDI appliances (certificate number 3332).

Note that the module must run NIOS version 8.2.6 with Hotfix-NIOS_8.2.6-371069_J67303_FIPS_2-6f0806b9bc9cbdcb9837391bb5a86a26-Tue-Aug-21-22-24-14-2018. For more information about the FIPS mode, refer to the following:

https://csrc.nist.gov/Projects/Cryptographic-Algorithm-Validation-Program
The Trinzic appliances can be made compliant with Common Criteria and FIPS 140-2 security standards. They contain a FIPS and Common Criteria certified cryptographic module that is utilized in both FIPS and/or Common Criteria modes. To comply with FIPS 140-2 requirements, you must properly affix the security label on the appliance. For more information, refer to the respective Installation Guide. To enable Common Criteria mode, execute the commands mentioned in Enabling/Disabling Common Criteria Mode. When you enable the Common Criteria mode, only the respective mode is enabled in the device.

Infoblox recommends that you configure FIPS mode if you want to configure only FIPS or both Common Criteria and FIPS certifications as it covers FIPS specific functionality (additional required POST testing) as well as Common Criteria certified cryptographic module and audit records. FIPS includes all features of Common Criteria mode and setting FIPS mode implicitly sets the Common Criteria mode. When you enable the FIPS mode in your device, it enables both FIPS and Common Criteria mode. This appendix is a supplement to Appendix C in which all information also applies to FIPS. For more information, see Guidance Documentation Supplement for Common Criteria. To enable and disable FIPS, see Enabling/Disabling FIPS.

To ensure that your appliance is FIPS compliant, make sure that your hardware and software settings match the evaluated configuration that was certified for FIPS. This document provides clarifications and changes to the Infoblox Administrator Guide and Infoblox CLI Guide, and should be used as the guiding document for installation of the TOE in the FIPS evaluated configuration.

This appendix contains the following sections:

- Managing Administrators
- Authenticating Admins using Remote Authentication
- Enabling/Disabling FIPS
- Installing FIPS Label on an Infoblox Trinzic Appliance
- FIPS (Federal Information Processing Standard) Certification
- List of NIOS Algorithms

Secure Initialization

Follow the instructions mentioned below to initialize the module in to FIPS approved mode of operation. Failure to follow the instructions below may result in a non-compliant system:

- The module must be running NIOS version 8.2.6 with Hotfix-NIOS_8.2.6-371069_J67303_FIPS_2-6f0806b9bc9837391bb5a86a26-Tue-Aug-21-22-24-14-2018.
- Apply tamper evident labels to the appliance as mentioned in the respective installation guide.
- Enable FIPS mode using the set fips_mode command. For more information, see Enabling/Disabling FIPS.
- The Minimum Password Length must be at least 6 characters. For more information, see Setting Password Restrictions for Local Admins.
- You cannot use the keys/CSPs (Cryptographic Critical Security Parameters), which are generated in a FIPS mode, in a non-FIPS mode and vice-versa.
- Infoblox does not support certain services while operating in the FIPS approved mode.

Non-Approved Services

Enabling any of the listed services may result in a non-compliant system.

</tbody>
</table>
Managing Administrators

A user must have an admin account to log in to the TOE. Each admin account belongs to an admin group, which contains roles and permissions that determine the tasks a user can perform.

The TOE provides a default superuser admin group, called admin-group, with one superuser administrator, admin. The default superuser admin can log in to the TOE, using the default user name admin and password infoblox. Superuser admins are the security admins and have full access and control of all the operations of a TOE. Note that you must change the default user name and password of the default superuser admin to prevent unauthorized access to the TOE. For more information about the tasks that superusers and limited-access admins can perform, see Guidance Documentation Supplement for Common Criteria.

Setting Password Restrictions for Local Admins

All admins are required to enter a username and password when they log in to Grid Manager or the CLI. A superuser can set minimum password length through Grid Manager. To set minimum password length, from the Grid tab -> Grid Properties -> Edit. In the Grid Properties editor, select the Password tab and specify the minimum number of characters that are required in a password. Note that the minimum password length must be between 4 and 64 characters. Ensure that the Minimum Password Length is at least 6 characters. You can specify character types, such as lowercase or uppercase characters, that are allowed in the password and the number of required character changes from the previous password, whether passwords expire and their duration. For information about defining the password policy, see Managing Passwords. TOE locks the user after five consecutive failed logins from the same IP address within a minute.

Authenticating Admins using Remote Authentication

NIOS supports the following remote authentication methods: AD domain controllers, RADIUS, LDAP, TACACS+, and Two-factor authentication and authenticates admins whose credentials are stored remotely on these servers. For more information, see About Remote Admins.

AD domain controllers

The minimum timeout value for AD domain controllers is one second. You must add domain controllers to an AD authentication server group and specify the minimum timeout value from the Grid Manager. To add domain controllers, from the Administration tab -> Authentication Server Groups tab -> Active Directory Services subtab, click the Add icon and enter the details in the Add Active Directory Authentication Service wizard. You can specify either SSL or CA Certificates as the encryption method. If you enable SSL encryption for AD, then CA certificates are used for LDAP communication. For more information, see Authenticating Admins Using Active Directory.

RADIUS

In this remote authentication process, NIOS sends an authentication request to a RADIUS server group. This is controlled by CC/FIPS mode. To configure a RADIUS authentication server group, from the Administration tab -> Authentication Server Groups tab, click the Add icon in the RADIUS Services subtab, and specify the details in the Add RADIUS Authentication Service wizard. For more information, see Authenticating Admins Using RADIUS.

Note: Do not use the RADIUS authentication method when you operate in the FIPS mode.

LDAP

NIOS authenticates admin accounts by verifying user names and passwords against LDAP. If you select SSL as the encryption type for LDAP, then the prefix of the LDAP URL is set to ldaps. Otherwise, it is set to ldap. To set encryption type for an LDAP server group, from the Administration tab -> Authentication Server Groups tab, click the Add icon in the LDAP Services subtab, and specify the details in the Add LDAP Authentication Service wizard. When you enable the common criteria mode, LDAP sets minimal TLS protocol to TLS 1.0 and TLS cipher suites to the following: "-ALL:DHE-RSA-AES256-SHA:DHE-RSA-AES128-SHA:AES256-SHA:AES128-SHA:". For more information, see Authenticating Admins Using LDAP.

TACACS+

TACACS+ provides separate authentication, authorization, and accounting services. This is controlled by CC/FIPS mode. You can configure a custom service, infoblox, on the TACACS+ server, and then define a user group and specify the group name in the custom attribute infoblox-admin-group. To configure a TACACS+ authentication server group, from the Administration tab -> Authentication Server Groups tab, click the Add icon in the TACACS+ Services subtab, and specify the details in the Add TACACS+ Service wizard. For more information, see Authenticating Admin Accounts Using TACACS+.

Note: Do not use the TACACS+ authentication method when you operate in the FIPS mode.
Two-factor authentication

You can configure NIOS to use the two-factor authentication method to authenticate users based on X.509 client certificates. In this authentication method, NIOS first negotiates SSL/TLS client authentication to validate client certificates and then authenticates the admins based on the configured authentication policy. You must first configure an authentication policy, and then configure and enable the certificate authentication service for the two-factor authentication to take effect. To configure and enable the two-factor authentication service, from the Administration tab -> Authentication Server Groups tab, click the Add icon in the Certificate Authentication Services subtab. OCSP service validates the certificates.

NIOS performs lookup against local users by default. You can enable remote lookup for user membership by choosing an Active Directory as authentication service and specifying the username and password for this service. Note that the password must not be empty. For more information, see Authenticating Admins Using Two-Factor Authentication.

Enabling/Disabling FIPS

You can enable and disable FIPS mode from the Infoblox CLI only. Do the following to set FIPS mode on the appliance:

1. Log in to the Infoblox CLI using a superuser account.
2. Enable FIPS mode using the following command:
   `Infoblox > set fips_mode`
3. Reboot the appliance, connect to the serial console and use the following command to check if the FIPS mode is enabled:
   `Infoblox > show fips_mode`
4. Verify if the following files exist in the directories mentioned:
   - `/infoblox/security/keys/integrity.key`
   - `/infoblox/security/keys/integrity.pem`
   - `/infoblox/security/sha256sum_bin.txt`
   - `/infoblox/security/sha256sum_bin.txt.sha256`

   **Note:** You cannot enable the Common Criteria mode when the FIPS mode is enabled, but note that Common Criteria mode is a subset of the FIPS mode. When you enable FIPS mode in your device, it enables both FIPS and Common Criteria mode. For more information about the Common Criteria mode, see Appendix C Guidance Documentation Supplement for Common Criteria.

For more information about the commands mentioned above, refer to the Infoblox CLI Guide. Upgrade the TOE only when the FIPS mode is enabled. The security administrator will be able to upgrade to a validated release package only. The security administrator can verify the TOE by the version number included in the file name as well as through the administrative interface before and after the upgrade. Refer to the Release Notes of the NIOS version to which the TOE is upgrading for additional upgrade instructions. To upgrade the TOE through Grid Manager, see Upgrading NIOS Software.

To revert the TOE to the previously running software, ensure that the FIPS mode is enabled. For more information, see Reverting the Grid to the Previously Running Software.

To disable FIPS mode, execute the following command: `Infoblox > set fips_mode`. You can verify if the FIPS mode is disabled using the following command: `Infoblox > show fips_mode`. Ensure that the files `/infoblox/security/sha256sum_bin.txt` and `/infoblox/security/sha256sum_bin.txt.sha256` are deleted.

To clear FIPS mode on an appliance, log in to the Infoblox CLI and execute the command: `reset all`.

The TOE reboots and goes through boot time self tests. If the test fails, the TOE goes into a loop and displays an error message on the serial console and the LCD. Otherwise, it displays the Login prompt after the self tests. Multi-Grid management is enabled as soon as Grid support becomes FIPS capable.

Note the following:

- When you configure a Grid Master and enable a certain, either CC or FIPS, mode in the Grid Master and then configure a Grid member with a different mode than that of the Grid Master, the member automatically takes the same mode as the Grid Master when you add this member to the Grid Master. For example, if the Grid Master is in FIPS mode and the Grid member is CC mode enabled, the Grid member becomes FIPS enabled when you add this member to the Grid.
- Consider an HA Grid Master with a certain, either CC or FIPS, mode enabled in the active node. When you join a passive node to the HA Grid Master, it automatically takes the same mode as the Grid Master in the active node. For example, if FIPS is enabled in the active node, then the passive node too becomes FIPS enabled when you join it to the HA Grid Master even though it was in CC mode earlier.
- When the HA pair is enabled, you cannot enable or disable either the CC or FIPS mode on the active or passive nodes.

Infoblox suggests that you do the following for an HA pair:

- Set either CC or FIPS mode on each node before building an HA pair.
- Set both the nodes of an HA pair in the same mode, that is either in the CC mode, or FIPS mode, or none.

Installing FIPS Label on an Infoblox Trinzic Appliance
The module must be opaque within the visible spectrum and have tamper evident labels for doors or removable covers in order to be compliant with FIPS 140-2 Security Level 2 requirements. Infoblox provides tamper evident labels (TEPs) which you must install on the appliance to operate in the FIPS approved mode. The Crypto Officer is responsible for inspecting the TEPs regularly for signs of tamper, and should contact Infoblox customer support if any signs of tamper are found.

Note that the SKU is IB-FIPS and includes 9 labels for each SKU order. The FIPS label is as shown below:

For more information about how to install FIPS label on the following appliances, refer to the respective installation guide: TE-825, TE-1425, TE-225, TE-4015, and TE-4025.

**FIPS (Federal Information Processing Standard) Certification**

You must configure the TOE to perform cryptographic operations using FIPS. To configure the FIPS mode setting, use the set fips_mode command. Enter y to enable and confirm the setting and another y to confirm that you are ready to continue.

Note: Infoblox does not recommend upgrade from a non FIPS system to a FIPS system.

Following are the events that are logged and examples of their corresponding syslog messages:

Event: BIND documentation
Message: ./fipscc_nios/bind9/bin/tools/isc-hmac-fixup.docbook:58: hash algorithm (i.e., SHA1 keys longer than 160 bits, SHA256 keys
38:Versions of BIND 9 up to and including BIND 9.6 had a bug causing HMAC-SHA* TSIG keys which were longer than the digest length of the hash algorithm (i.e., SHA1 keys longer than 160 bits, SHA256 keys longer than 256 bits, etc) to be used incorrectly, generating a message authentication code that was incompatible with other DNS implementations.

46:and specify the key's algorithm and secret on the command line. If the secret is longer than the digest length of the algorithm (64 bytes for SHA1 through SHA256, or 128 bytes for SHA384 and SHA512), then a new secret will be generated consisting of a hash digest of the old secret. (If the secret did not require conversion, then it will be printed without modification.)

</table>
This module uses functions `cd_derive_serial`, `cd_verify_msg` from module `/products/one/server/src/bin/clusterd/util.c`

Function `cd_derive_serial` derives a serial number from a string using SHA1 digest algorithm,

it is used in functions `cd_master_handshake_chal`,
`cd_potential_master_handshake_chal`, `cd_master_handshake_resp_chal`,
`cd_master_handshake_resp_req`, Function
`cd_potential_master_handshake_resp_req`, `cd_replica_handshake_resp_chal`

Function `cd_verify_msg` verifies a message signed by HMAC-SHA256,

it is used in functions `cd_master_handshake_approval_verify`,
`cd_master_handshake_tunnel_request_verify`,
`cd_potential_master_handshake_verify`,
`cd_master_handshake_new_master_verify`,
`cd_replica_handshake_approval`, `cd_replica_handshake_tunnel_approved`,
`cd_replica_handshake_restart`

This module uses functions `ib_generate_authn_challenge`,
`ib_generate_authn_response`, `ib_generate_authn_response_2` from module
`./common/server/src/lib/security/security_functions.c`

Function `ib_generate_authn_challenge` generates auth challenge, it performs base64 encoding with OpenSSL function `EVP_EncodeBlock`,

it is used in functions `cd_master_handshake_chal`,
`cd_potential_master_handshake_chal`

Function `ib_generate_authn_response` generates auth response computing MD5 hash, it is used in NIOS versions less than 6.3,

Function `ib_generate_authn_response_2` generates auth response using HMAC_SHA256 algorithm, it is used in NIOS versions equal or greater than 6.3,

they are used in functions `cd_master_handshake_chal`,
`cd_potential_master_handshake_chal`, `cd_master_handshake_resp_chal`,
`cd_master_handshake_resp_req`, `cd_potential_master_handshake_resp_req`,
`cd_replica_handshake_resp_chal`

To generate host keys

```
ssh-keygen -t rsa -f "$SSHD_HOST_RSA_KEY" >/dev/null
ssh-keygen -t dsa -f "$SSHD_HOST_DSA_KEY"
```

Remote authentication

Active Directory Services
`./products/one/server/src/pyabs/ad_auth.py`, imports ldap package
Function `AdAuthService.authenticate` does AD authentication,

it uses function `make_ldap_url(address, port, ssl)` from module
`./products/one/server/src/pyabs/ldap_auth_service.py`
to make up ldap url as ldaps://address:port if property 'encryption' = 'SSL'
otherwise the url prefix is ldap://,
the ldap url is used in function call 'conn = ldap.initialize(url)'

No OpenSSL function calls

Remote authentication

LDAP Services
`./products/one/server/src/pyabs/ldap_auth_service.py`, imports ldap package
Function `LdapAuthService.authenticate` authenticates users against LDAP servers,

it uses function `make_ldap_url(address, port, ssl)` from this module
to make up ldap url as ldaps://address:port if property 'encryption' = 'SSL'
otherwise the url prefix is ldap://,
the ldap url is used in function call 'conn = ldap.initialize(url)'

No OpenSSL function calls

Remote authentication

RADIUS Services
`./products/one/server/src/pyabs/radius_auth_service.py`

Function `RadiusAuthService.authenticate` does RADIUS authentication,

it uses functions from module
`./products/one/server/src/lib/one_rtxml_functions/radius.c`

No OpenSSL function calls

used in the following python module:
./products/one/server/src/bin/make_certs.py, function make_cert_and_key
Function ipki_key_pem_to_bin - given a file that contains a PEM formatted
private key, returns its DER encoded data,
it is used in module:
./products/one/server/src/bin/make_default_apache_cert/main.c, function
mhc_read_https_cert_files

infoblox pki lib
./products/one/server/src/lib/pki/ipki_gen.c
Function ipki_set_serial_number sets a certificate serial number,
it is used in this module, functions ipki_create_selfsigned_cert, ipki_sign_cert
Function ipki_create_key creates a public/private key pair,
it is used in this module, function ipki_generate_csr
Function ipki_build_csr builds a CSR from given info,
it is used in this module, functions ipki_generate_csr, ipki_resign_csr
Function ipki_check_selfsigned_cert checks if a cert is self-signed,
it is used in module
./products/one/server/src/lib/one_rtxml_functions/system_administration.c,
function one_get_https_cert
Function ipki_create_selfsigned_cert generates a self signed cert,
it is used in modules:
./products/one/server/src/lib/pki/ipki_api.c, functions
ipki_generate_and_store_server_cert, ipki_sign_csr_and_encode_cert
./products/one/server/src/bin/make_default_apache_cert/main.c, function
mhc_write_default_https_cert_files
Function ipki_sign_cert signs a cert with a CA and returns the binary cert in a
buffer,
it is used in module ./products/one/server/src/lib/pki/ipki_api.c, function
ipki_sign_csr_by_ca

OpenSSL C-functions:
X509_get_pubkey, X509_get_subject_name

- ./products/one/server/src/outbound/lib/ssl_requests.py

A generate certificate button on DXL endpoint
Upload and validate DXL endpoint certificate

bind9

Function

Function openssldsa_createctx() creates, initializes and setup Digest context.
Function openssldsa_destroyctx() cleans up digest context ctx and frees up the space allocated to it.
Function openssldsa_adddata() hashes cnt data to digest context ctx.
Function openssldsa_sign()signs the data in ctx using the private key pkey and places the signature in sig.
Function openssldsa_verify() verifies the data
Function openssldsa_destroy() DSA_free() is called.
openssldsa_fromdns()
Function openssldsa_parse() is used to parse private key

OpenSSL C-functions

EVP_MD_CTX_create,EVP_DigestInit_ex,

### Python code

**./products/gog/server/src/pyutil/cert_util.py**

Function `create_temp_cert` creates a temporary certificate (generates an RSA key pair with key length of 2048 bits, public and sign key with md=SHA1), it is used in function `make_join_file`

Function `make_join_file` returns join token, it is used in module **./products/gog/server/src/pyutil/gog_common.py**, function `get_join_info`

Function `m2_generate_and_encode_csr` generates signed request, private and public key, it is used in functions `gen_ca_cert`, `check_mgm_cert`, `check_node`, `check_sso`

Function `m2_sign_csr` returns signed certificate, it is used in function `gen_ca_cert`

Function `m2_sign_csr_by_ca` returns signed by CA certificate, it is used in functions `check_mgm_cert`, `check_node`, `check_sso`, `sign_csr`

Function `m2_create_req` creates a X509 certificate request, it is used in functions `create_temp_cert`, `m2_generate_and_encode_csr`

Function `m2_create_cert_and_sign` creates a certificate from a request and sign it, it is used in functions `create_temp_cert`, `m2_sign_csr`, `m2_sign_csr_by_ca`

Function `m2_b64_str_to_rsa` feeds a pem string to RSA, it is used in functions `m2_generate_and_encode_csr`, `m2_sign_csr`, `m2_sign_csr_by_ca`

**/products/gog/server/src/pyutil/sgm_daemon_util.py**

Function `DBTask.execute_connect` handles connect request from subgrid, it is used in `DBTask.__init__` to initialize an action map

Function `GoGListenerMsg.__create_digest` signs a digest with the private key using SHA256, it is used in `GoGListenerMsg.send_msg`

**/products/gog/server/src/pyutil/external_storage_connection.py**

Function `SignatureWrapper.reset` initializes a signature by a new hmac object with digestmod = SHA256, `SignatureWrapper` is the base class of classes `HTTPResponseWrapper`, `BufferWrapper`, `FileWrapper`, `FileWrapper`, `BufferWrapper`

### Package M2Crypto functions:

- RSA.gen_key, RSA.load_key
- EVP.PKey with md=SHA1 by default
- X509.load_cert, load_request_string, load_cert_string, Request
- X509_Name, set_serial_number, set_version, set_subject, set_issuer, set_pubkey, set_not_before, set_not_after, sign
- ASN1.ASN1_UTCTIME

### Package M2Crypto functions:

- X509.load_cert_string

### Package hashlib functions:

- hashlib.sha256

### Package hmac functions:

- hmac.new

```

HSM

```
Primarily used for DNSSEC
modules which use OpenSSL functions:
. /products/one/server/src/pyabs/hsm_safenet_group.py
Function HSMSafeNetGroup.validate_sign_algo checks the signature algo from the server certificate, it is used in HSMSafeNetGroup.restore_server_cert which is used in insert, update
```

Openssl command: `openssl x509 -in cert_path -text`

**Appendix E Regular Expressions**

**Supported Expressions for Search Parameters**

Regular expressions are text strings that you use to describe search patterns. You can use the following special characters to define regular expressions for search parameters.

<table>
<thead>
<tr>
<th>Special character</th>
<th>Purpose</th>
<th>Example</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>()</td>
<td>Defines the scope and precedence of the operator</td>
<td>gr(a(e)y)</td>
<td>Matches “gray” or “grey”.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>Matches either the regular expression before or after the vertical bar</td>
<td>a</td>
<td>c</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>-</td>
<td>Matches any single character</td>
<td>.at</td>
<td>Matches any text string ending with “at”, such as “hat”, “cat”, and “bat”.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>*</td>
<td>Matches the previous regular expression zero or more times</td>
<td>a*bc</td>
<td>Matches zero or multiple occurrences of “a” followed by “bc”, such as “bc”, “abc”, “aabbc”, “aabc”, and so on.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>+</td>
<td>Matches the previous regular expression one or more times</td>
<td>a+bc</td>
<td>Matches one or more occurrences of “a”, followed by “bc”,”abc”, “aabbc”, “aabc”, and so on.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>?</td>
<td>Matches the previous regular expression zero or one time</td>
<td>a?bc</td>
<td>Matches zero or one occurrence of “a”, followed by “bc”, such as “bc” or “abc”.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>^</td>
<td>Matches the beginning of a text string</td>
<td>^c</td>
<td>Matches any string beginning with “c”, such as “cat”.</td>
</tr>
</tbody>
</table>
$  Matches the end of a text string
com$  Matches any string ending with "com", such as "Infoblox.com".

[ ]  Matches any character specified in the brackets
[03] [abcd] [1a-d]  Matches 0" or 3.

[ n-n]  Matches single characters contained in the specified range, including the start and end points
[0-3] [a-f]  Matches 0, 1, 2, and 3.

\(m,n\)  Matches the preceding expression at least m but not more than n times.
a\(\{3,5\}\)  Matches "aaa", "aaaa", and "aaaaa".

Note: You can change a special character—such as the period (.), asterisk (*), plus sign (+), or question mark (?)—into a literal character by prefixing it with a backslash (\). For example, to specify a literal period, asterisk, plus sign, or question mark, use the characters within the following parentheses: (\.), (\*), (\+), (?), (\^), (\$).

Appendix F NIOS Virtual Appliances

NIOS virtual appliances support most of the features of the Infoblox NIOS software, with some limitations. This appendix describes these limitations. Table E.1 summarizes the supported NIOS virtual appliance models.

Note: VMware Tools are automatically installed for each NIOS virtual appliance. Infoblox supports the control functions in Hyper-V Manager and VMware Tools. For example, through the vSphere client, you can shut down the virtual appliance.

Table E.1 Supported NIOS virtual Appliance Models and Specifications

**NOTES:**

- You can freely assign resources to these virtual appliances to suit your business needs, as long as the resources are within the limits of the licenses being installed on the appliances.

1For KVM hypervisor only. Not supported for KVM-based OpenStack. Does not support Elastic Scaling.

2NIOS virtual appliance for Hyper-V is not recommended as a Grid Master or Grid Master Candidate. IB-VM-820 with 55 GB disk is not supported as the Grid Master or Grid Master Candidate for the NIOS virtual for KVM. The Identity Mapping feature is supported on the IB-VM-810 and IB-VM-820 appliances only if they are configured as Grid members, not as the Grid Master.
Does not support Elastic Scaling.

NIOS for KVM is supported in the following environments: OpenStack, RHEL, SuSE Enterprise and Cloud, and CentOS. Note that only IB-V1405 as a Reporting server has been qualified for OpenStack.

ND virtual appliances are designed for Network Insight only. Discovery is supported in OpenStack only with SRIOV enabled. For information about the limitations on each NIOS virtual appliance, see the following:

- NIOS for Riverbed
- NIOS for VMware
- NIOS for Hyper-V
- NIOS for Xen

NIOS for Riverbed

NIOS virtual appliances on Riverbed have the following limitations:

- They can function as Grid members only. You cannot configure them as HA (high availability) pairs, Grid Masters, Grid Master candidates, or independent appliances.
- On a Grid with a NIOS virtual appliance on Riverbed as a Grid member, the maximum storage space for HTTP, FTP and TFTP is 1 GB (a Grid with only Infoblox appliances provides a maximum of 5 GB for these services), core files are 100 MB each, and syslog and infoblox.log files are 20 MB each. Scheduled backup file is 100 MB.
- The LAN interface is the only network interface available on the NIOS virtual appliance. You cannot configure the speed and transmission type (full or half duplex) of the network interface.
- You can use the traffic capture tool of the NIOS virtual software package to capture traffic only on the LAN port of the NIOS virtual appliance.
- NIOS virtual appliances on Riverbed do not support the following features:
  - Anycast addressing
  - Configuration as a DHCP lease history logging member
  - Dedicated MGMT port
  - NTP service
  - bloxTools environment
  - Configuration for managing Microsoft® Windows DNS servers

NIOS for VMware

The Infoblox NIOS for VMware can also run on Cisco SRE-V (Services Ready Engine Virtualization), which is part of the Cisco UCS (Unified Computing System) Express. For more information about NIOS virtual for VMware, refer to the Infoblox Installation Guide for NIOS Software on VMware.

NIOS virtual for VMware appliances support most of the features of the Infoblox NIOS appliances, with the following limitations:

- You must have a NIOS virtual license installed on the appliance before you can access the Infoblox GUI.
- NIOS virtual appliances do not support the following features:
  - Configuration of port settings for MGMT, LAN, LAN2, and HA ports
  - The bloxTools environment
  - The IB-BOB virtual appliance is supported on Cisco SRE-V and can function as a Grid member only. It does not support configuration as an independent appliance, an HA pair, a Grid Master, or a Grid Master candidate. It also does not support access to the Infoblox GUI.
  - The IB-VM-250 virtual appliance supports all the services provided by NIOS virtual appliances, but it is not recommended as a Grid Master or Grid Master candidate.
  - When you configure an HA pair, both nodes in the HA pair must be NIOS instances. You cannot configure a physical NIOS appliance and a NIOS virtual instance in an HA pair.
  - NIOS virtual appliances run on virtual hardware. They do not have sensors to monitor the physical CPU temperature, fan speed, and system temperature.
  - Changing the NIOS virtual appliance settings through the VMware vSphere or vCenter console may violate the terms of the NIOS virtual licensing and support models. The NIOS virtual appliance may not join the Grid or function properly.

NIOS for Hyper-V

NIOS virtual for Microsoft Windows 2008 R2 and 2012 R2 server appliances support most of the features of the Infoblox NIOS appliances, with the following limitations:

- You must have a NIOS virtual license installed on the appliance before you can access the Infoblox GUI.
- NIOS virtual appliances do not support the following features:
  - Configuration of port settings for MGMT, LAN, LAN2, and HA ports
  - The bloxTools environment
  - All the IB-VM appliance models support all the services provided by NIOS virtual appliances, but Grid Master or Grid Master Candidate is not supported.
  - The Captive Portal is supported only on IB-VM-1410 virtual appliances.
  - NIOS virtual appliances run on virtual hardware. They do not have sensors to monitor the physical CPU temperature, fan speed, and system temperature.
  - Changing the NIOS virtual appliance settings through the Hyper-V Manager or Virtual Machine Manager Administrator console may violate the terms of the NIOS virtual licensing and support models. The NIOS virtual appliance may not join the Grid or function properly.
NIOS for Xen

NIOS virtual appliance for Xen supports most of the features of the Infoblox NIOS appliances, with the following limitations:

- NIOS virtual appliances do not support the following features:
  - Configuration of port settings for MGMT, LAN, LAN2, and HA ports
  - The bloxTools environment
- When you configure an HA pair, both nodes in the HA pair must be NIOS virtual instances. You cannot configure a physical NIOS appliance and a NIOS virtual instance in an HA pair.
- NIOS virtual appliances run on virtual hardware. They do not have sensors to monitor the physical CPU temperature, fan speed, and system temperature.
- Changing the NIOS virtual appliance settings through the NIOS virtual for Xen virtual appliance console may violate the terms of the NIOS virtual licensing and support models. The NIOS virtual appliance may not join the Grid or function properly.

Appendix G Product Compliance

This appendix describes the hardware components, requirements, and specifications, plus agency and RFC (Request for Comments) compliance for the Infoblox appliance. Topics in this appendix include:

- Power Safety Information
- AC
- DC
- Agency Compliance
  - FCC
  - Canadian Compliance
- RFC Compliance
  - DNS RFC Compliance
  - DHCP RFC Compliance
  - DHCPv6 RFC Compliance
  - IDN (Internationalized Domain Names) RFC Compliance

Power Safety Information

The main external power connector for the Infoblox appliance is located on the back of the system. Ensure power to the system is off before connecting the power cord into the power connector. Please read the following power safety statements for your AC- or DC-powered appliance:

AC

English

**WARNING:** This product relies on the building’s installation for short-circuit (overcurrent) protection. Ensure that a fuse or circuit breaker no larger than 120VAC, 15A U.S. (240VAC, 10A international) is used on the phase conductors (all current-carrying conductors).

French

**WARNING:** Pour ce qui est de la protection contre les courts-circuits (surtension), ce produit dépend de l’installation électrique du local. Vérifier qu’un fusible ou qu’un disjoncteur de 120V alt., 15A U.S. maximum (240V alt., 10A international) est utilisé sur les conducteurs de phase (conducteurs de charge).

German

**WARNING:** Dieses Produkt ist darauf angewiesen, daß im Gebäude ein Kurzschluß - bzw. Überstromschutz installiert ist. Stellen Sie sicher, daß eine Sicherung oder ein Unterbrecher von nicht mehr als 240V Wechselstrom, 10A (bzw. in den USA120V Wechselstrom, 15A) an den Phasenleitern (allen Stromf, hrenden Leitern) verwendet wird.

DC

English

**WARNING:** When stranded wiring is required, use approved wiring terminations, such as closed-loop or spade-type with upturned lugs. These ter
Agency Compliance

The Infoblox appliance is compliant with these EMI and safety agency regulations:

**FCC**

The FCC label on the back of the system indicates this network appliance is compliant with limits for a Class A digital device in accordance with Part 15 of the FCC Rules. These limits are designed to provide reasonable protection against harmful interference when this equipment is operated in a commercial environment. Operation is subject to the following two conditions:

- This device might not cause harmful interference.
- This device must accept any interference received, including interference that may cause undesired operation.

This device generates, uses, and can radiate radio frequency energy if not installed and used in accordance with the instructions in this manual. Operating this equipment in a residential area is likely to cause harmful interference, and the customer will be required to rectify the interference at his or her own expense. This product requires the use of external shielded cables to maintain compliance pursuant to Part 15 of the FCC Rules.

**Canadian Compliance**

**English**

This Class A digital apparatus complies with Canadian ICES-003.

**French**

Cet appareil numérique de la classe A est conforme à la norme NMB-003 du Canada.

**VCCI**

The Infoblox appliance complies with this VCCI regulation (compliance statement follow by its translation):

この装置は、情報処理装置等電波障害自主規制協議会（VCCI）の基準に基づくクラスA情報技術装置です。この装置を家庭環境で使用すると電波妨害を引き起こすことがあります。この場合には使用者が適切な対策を講ずるよう要求されることがあります。

This is a Class A product based on the Technical Requirements of the Voluntary Control Council for Interference Technology (VCCI). In a domestic environment this product may cause radio interference, in which case the user may be required to take corrective action.

**Caution**: Lithium battery included with this board. Do not puncture, mutilate, or dispose of battery in fire. Danger of explosion if battery is incorrectly replaced. Replace only with the same or equivalent type recommended by manufacturer. Dispose of used battery according to manufacturer instructions and in accordance with your local regulations.
RFC Compliance

The NIOS appliance is compliant with the following:

- Qualys and Nessus security requirements
- Joint Interoperability Test Command (JITC) certification for Internet Protocol version 6 capability
- RFCs (Request for Comments):
  - DNS RFC Compliance
  - DHCP RFC Compliance
  - DHCPv6 RFC Compliance
  - IDN (Internationalized Domain Names) RFC Compliance

DNS RFC Compliance

The NIOS appliance complies with the following DNS RFCs:

Preamble

The licenses for most software are designed to take away your freedom to share and change it. By contrast, the GNU General Public License is intended to guarantee your freedom to share and change free software--to make sure the software is free for all its users. This General Public License applies to most of the Free Software Foundations software and to any other program whose authors commit to using it. (Some other Free Software Foundation software is covered by the GNU Library General Public License instead.) You can apply it to your programs, too.

When we speak of free software, we are referring to freedom, not price. Our General Public Licenses are designed to make sure that you have the freedom to distribute copies of free software (and charge for this service if you wish), that you receive source code or can get it if you want it, that you can change the software or use pieces of it in new free programs; and that you know you can do these things.

To protect your rights, we need to make restrictions that forbid anyone to deny you these rights or to ask you to surrender the rights. These restrictions translate to certain responsibilities for you if you distribute copies of the software, or if you modify it.

For example, if you distribute copies of such a program, whether gratis or for a fee, you must give the recipients all the rights that you have. You must make sure that they, too, receive or can get the source code. And you must show them these terms so they know their rights.

We protect your rights with two steps: (1) copyright the software, and (2) offer you this license which gives you legal permission to copy, distribute and/or modify the software.

Also, for each authors protection and ours, we want to make certain that everyone understands that there is no warranty for this free software. If the software is modified by someone else and passed on, we want its recipients to know that what they have is not the original, so that any problems introduced by others will not reflect on the original authors reputations.

Finally, any free program is threatened constantly by software patents. We wish to avoid the danger that redistributors of a free program will individually obtain patent licenses, in effect making the program proprietary. To prevent this, we have made it clear that any patent must be licensed for everyones free use or not licensed at all.

The precise terms and conditions for copying, distribution and modification follow.

GNU GENERAL PUBLIC LICENSE
TERMS AND CONDITIONS FOR COPYING, DISTRIBUTION AND MODIFICATION

0. This License applies to any program or other work which contains a notice placed by the copyright holder saying it may be distributed under the terms of this General Public License. The "Program", below, refers to any such program or work, and a "work based on the Program" means either the Program or any derivative work under copyright law: that is to say, a work containing the Program or a portion of it, either verbatim or with modifications and/or translated into another language. (Hereinafter, translation is included without limitation in the term "modification".) Each licensee is addressed as "you". Activities other than copying, distribution and modification are not covered by this License; they are outside its scope. The act of running the Program is not restricted, and the output from the Program is covered only if its contents constitute a work based on the Program (independent of having been made by running the Program). Whether that is true depends on what the Program does.

1. You may copy and distribute verbatim copies of the Programs source code as you receive it, in any medium, provided that you conspicuously and appropriately publish on each copy an appropriate copyright notice and disclaimer of warranty; keep intact all the notices that refer to this License and to the absence of any warranty; and give any other recipients of the Program a copy of this License along with the Program.

You may charge a fee for the physical act of transferring a copy, and you may at your option offer warranty protection in exchange for a fee.

2. You may modify your copy or copies of the Program or any portion of it, thus forming a work based on the Program, and copy and distribute such modifications or work under the terms of Section 1 above, provided that you also meet all of these conditions:
a. You must cause the modified files to carry prominent notices stating that you changed the files and the date of any change.
b. You must cause any work that you distribute or publish, that in whole or in part contains or is derived from the Program or any part thereof, to be licensed as a whole at no charge to all third parties under the terms of this License.
c. If the modified program normally reads commands interactively when run, you must cause it, when started running for such interactive use in the most ordinary way, to print or display an announcement including an appropriate copyright notice and a notice that there is no warranty (or else, saying that you provide a warranty) and that users may redistribute the program under these conditions, and telling the user how to view a copy of this License. (Exception: if the Program itself is interactive but does not normally print such an announcement, your work based on the Program is not required to print an announcement.)

These requirements apply to the modified work as a whole. If identifiable sections of that work are not derived from the Program, and can be reasonably considered independent and separate works in themselves, then this License, and its terms, do not apply to those sections when you distribute them as separate works. But when you distribute the same sections as part of a whole which is a work based on the Program, the distribution of the whole must be on the terms of this License, whose permissions for other licensees extend to the entire whole, and thus to each and every part regardless of who wrote it.

Thus, it is not the intent of this section to claim rights or contest your rights to work written entirely by you; rather, the intent is to exercise the right to control the distribution of derivative or collective works based on the Program.

In addition, mere aggregation of another work not based on the Program with the Program (or with a work based on the Program) on a volume of a storage or distribution medium does not bring the other work under the scope of this License.

3. You may copy and distribute the Program (or a work based on it, under Section 2) in object code or executable form under the terms of Sections 1 and 2 above provided that you also do one of the following:
   a. Accompany it with the complete corresponding machine-readable source code, which must be distributed under the terms of Sections 1 and 2 above on a medium customarily used for software interchange; or,
   b. Accompany it with a written offer, valid for at least three years, to give any third party, for a charge no more than your cost of physically performing source distribution, a complete machine-readable copy of the corresponding source code, to be 11 distributed under the terms of Sections 1 and 2 above on a medium customarily used for software interchange; or,
   c. Accompany it with the information you received as to the offer to distribute corresponding source code. (This alternative is allowed only for noncommercial distribution and only if you received the program in object code or executable form with such an offer, in accord with Subsection b above.)

The source code for a work means the preferred form of the work for making modifications to it. For an executable work, complete source code means all the source code for all modules it contains, plus any associated interface definition files, plus the scripts used to control compilation and installation of the executable. However, as a special exception, the source code distributed need not include anything that is normally distributed (in either source or binary form) with the major components (compiler, kernel, and so on) of the operating system on which the executable runs, unless that component itself accompanies the executable.

If distribution of executable or object code is made by offering access to copy from a designated place, then offering equivalent access to copy the source code from the same place counts as distribution of the source code, even though third parties are not compelled to copy the source along with the object code.

4. You may not copy, modify, sublicense, or distribute the Program except as expressly provided under this License. Any attempt otherwise to copy, modify, sublicense or distribute the Program is void, and will automatically terminate your rights under this License. However, parties who have received copies, or rights, from you under this License will not have their licenses terminated so long as such parties remain in full compliance.

5. You are not required to accept this License, since you have not signed it. However, nothing else grants you permission to modify or distribute the Program or its derivative works. These actions are prohibited by law if you do not accept this License. Therefore, by modifying or distributing the Program (or any work based on the Program), you indicate your acceptance of this License to do so, and all its terms and conditions for copying, distributing or modifying the Program or works based on it.

6. Each time you redistribute the Program (or any work based on the Program), the recipient automatically receives a license from the original licensor to copy, distribute or modify the Program subject to these terms and conditions. You may not impose any further restrictions on the recipients exercise of the rights granted herein. You are not responsible for enforcing compliance by third parties to this License.

7. If, as a consequence of a court judgment or allegation of patent infringement or for any other reason (not limited to patent issues), conditions are imposed on you (whether by court order, agreement or otherwise) that contradict the conditions of this License, they do not excuse you from the conditions of this License. If you cannot distribute so as to satisfy simultaneously your obligations under this License and any other pertinent obligations, then as a consequence you may not distribute the Program at all. For example, if a patent license would not permit royalty-free redistribution of the Program by all those who receive copies directly or indirectly through you, then the only way you could satisfy both it and this License is to refrain entirely from distribution of the Program.

If any portion of this section is held invalid or unenforceable under any particular circumstance, the balance of the section is intended to apply and the section as a whole is intended to apply in other circumstances.

It is not the purpose of this section to induce you to infringe any patents or other property right claims or to contest validity of any such claims; this section has the sole purpose of protecting the integrity of the free software distribution system, which is implemented by public license practices. Many people have made generous contributions to the wide range of software distributed through that system in reliance on consistent application of that system; it is up to the author/donor to decide if he or she is willing to distribute software through any other system and a licensee cannot impose that choice.

This section is intended to make thoroughly clear what is believed to be a consequence of the rest of this License.

8. If the distribution and/or use of the Program is restricted in certain countries either by patents or by copyrighted interfaces, the original copyright holder who places the Program under this License may add an explicit geographical distribution limitation excluding those countries, so that distribution is permitted only in or among countries not thus excluded. In such case, this License incorporates the limitation as if written in the body of this License.

9. The Free Software Foundation may publish revised and/or new versions of the General Public License from time to time. Such new versions will be similar in spirit to the present version, but may differ in detail to address new problems or concerns. Each version is given a distinguishing version number. If the Program specifies a version number of this License which applies to it and any later version, you have the option of following the terms and conditions either of that version or of any later version published by the Free Software Foundation. If the Program does not specify a version number of this License, you may choose any version ever published by the Free Software Foundation.

10. If you wish to incorporate parts of the Program into other free programs whose distribution conditions are different, write to the author to
ask for permission. For software which is copyrighted by the Free Software Foundation, write to the Free Software Foundation; we sometimes make exceptions for this. Our decision will be guided by the two goals of preserving the free status of all derivatives of our free software and of promoting the sharing and reuse of software generally.

NO WARRANTY

11. BECAUSE THE PROGRAM IS LICENSED FREE OF CHARGE, THERE IS NO WARRANTY FOR THE PROGRAM, TO THE EXTENT PERMITTED BY APPLICABLE LAW. EXCEPT WHEN OTHERWISE STATED IN WRITING THE COPYRIGHT HOLDERS AND/OR OTHER PARTIES PROVIDE THE PROGRAM "AS IS" WITHOUT WARRANTY OF ANY KIND, EITHER EXPRESSED OR IMPLIED, INCLUDING, BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE. THE ENTIRE RISK AS TO THE QUALITY AND PERFORMANCE OF THE PROGRAM IS WITH YOU. SHOULD THE PROGRAM PROVE DEFECTIVE, YOU ASSUME THE COST OF ALL NECESSARY SERVICING, REPAIR OR CORRECTION.

12. IN NO EVENT UNLESS REQUIRED BY APPLICABLE LAW OR AGREED TO IN WRITING WILL ANY COPYRIGHT HOLDER, OR ANY OTHER PARTY WHO MAY MODIFY AND/OR REDISTRIBUTE THE PROGRAM AS PERMITTED ABOVE, BE LIABLE TO YOU FOR DAMAGES, INCLUDING ANY GENERAL, SPECIAL, INCIDENTAL OR CONSEQUENTIAL DAMAGES ARISING OUT OF THE USE OR INABILITY TO USE THE PROGRAM (INCLUDING BUT NOT LIMITED TO LOSS OF DATA OR DATA BEING RENDERED INACCURATE OR LOSSES SUSTAINED BY YOU OR THIRD PARTIES OR A FAILURE OF THE PROGRAM TO OPERATE WITH ANY OTHER PROGRAMS), EVEN IF SUCH HOLDER OR OTHER PARTY HAS BEEN ADVISED OF THE POSSIBILITY OF SUCH DAMAGES.

END OF TERMS AND CONDITIONS

GNU Lesser General Public License

GNU LESSER GENERAL PUBLIC LICENSE
Version 2.1, February 1999

Copyright (C) 1991, 1999 Free Software Foundation, Inc.

59 Temple Place, Suite 330, Boston, MA 02111-1307 USA

Everyone is permitted to copy and distribute verbatim copies of this license document, but changing it is not allowed.

[This is the first released version of the Lesser GPL. It also counts as the successor of the GNU Library Public License, version 2, hence the version number 2.1.]

Preamble

The licenses for most software are designed to take away your freedom to share and change it. By contrast, the GNU General Public Licenses are intended to guarantee your freedom to share and change free software--to make sure the software is free for all its users.

This license, the Lesser General Public License, applies to some specially designated software packages-typically libraries-of the Free Software Foundation and other authors who decide to use it. You can use it too, but we suggest you first think carefully about whether this license or the ordinary General Public License is the better strategy to use in any particular case, based on the explanations below.

When we speak of free software, we are referring to freedom, not price. Our General Public Licenses are designed to make sure that you have the freedom to distribute copies of free software (and charge for this service if you wish); that you receive source code or can get it if you want it; that you can change the software and use pieces of it in new free programs; and that you are informed that you can do these things.

To protect your rights, we need to make restrictions that forbid distributors to deny you these rights or to ask you to surrender these rights. These restrictions translate to certain responsibilities for you if you distribute copies of the library or if you modify it.

For example, if you distribute copies of the library, whether gratis or for a fee, you must give the recipients all the rights that we gave you. You must make sure that they, too, receive or can get the source code. If you link other code with the library, you must provide complete object files to the recipients, so that they can relink them with the library after making changes to the library and recompiling it. And you must show them these terms so they know their rights.

We protect your rights with a two-step method: (1) we copyright the library, and (2) we offer you this license, which gives you legal permission to copy, distribute and/or modify the library.

To protect each distributor, we want to make it very clear that there is no warranty for the free library. Also, if the library is modified by someone else and passed on, the recipients should know that what they have is not the original version, so that the original authors reputation will not be affected by problems that might be introduced by others.

Finally, software patents pose a constant threat to the existence of any free program. We wish to make sure that a company cannot effectively restrict the users of a free program by obtaining a restrictive license from a patent holder. Therefore, we insist that any patent license obtained for a version of the library must be consistent with the full freedom of use specified in this license.

Most GNU software, including some libraries, is covered by the ordinary GNU General Public License. This license, the GNU Lesser General Public License, applies to certain designated libraries, and is quite different from the ordinary General Public License. We use this license for certain libraries in order to permit linking those libraries into non-free programs.

When a program is linked with a library, whether statically or using a shared library, the combination of the two is legally speaking a combined work, a derivative of the original library. The ordinary General Public License therefore permits linking only if the entire combination fits its criteria of freedom. The Lesser General Public License permits more lax criteria for linking other code with the library.
We call this license the “Lesser” General Public License because it does Less to protect the users freedom than the ordinary General Public License. It also provides other free software developers Less of an advantage over competing non-free programs. These disadvantages are the reason we use the ordinary General Public License for many libraries. However, the Lesser license provides advantages in certain special circumstances.

For example, on rare occasions, there may be a special need to encourage the widest possible use of a certain library, so that it becomes a de-facto standard. To achieve this, non-free programs must be allowed to use the library. A more frequent case is that a free library does the same job as widely used non-free libraries. In this case, there is little to gain by limiting the free library to free software only, so we use the Lesser General Public License.

In other cases, permission to use a particular library in non-free programs enables a greater number of people to use a large body of free software. For example, permission to use the GNU C Library in non-free programs enables many more people to use the whole GNU operating system, as well as its variant, the GNU/Linux operating system.

Although the Lesser General Public License is Less protective of the users freedom, it does ensure that the user of a program that is linked with the Library has the freedom and the wherewithal to run that program using a modified version of the Library.

The precise terms and conditions for copying, distribution and modification follow. Pay close attention to the difference between a "work based on the library" and a "work that uses the library". The former contains code derived from the library, whereas the latter must be combined with the library in order to run.

GNU LESSER GENERAL PUBLIC LICENSE

TERMS AND CONDITIONS FOR COPYING, DISTRIBUTION AND MODIFICATION

0. This License Agreement applies to any software library or other program which contains a notice placed by the copyright holder or other authorized party saying it may be distributed under the terms of this Lesser General Public License (also called "this License"). Each licensee is addressed as "you".

A "library" means a collection of software functions and/or data prepared so as to be conveniently linked with application programs (which use some of those functions and data) to form executables.

The "Library", below, refers to any such software library or work which has been distributed under these terms. A "work based on the Library" means either the Library or any derivative work under copyright law: that is to say, a work containing the Library or a portion of it, either verbatim or with modifications and/or translated straightforwardly into another language. (Hereinafter, translation is included without limitation in the term "modification").

"Source code" for a work means the preferred form of the work for making modifications to it. For a library, complete source code means all the source code for all modules it contains, plus any associated interface definition files, plus the scripts used to control compilation and installation of the library.

Activities other than copying, distribution and modification are not covered by this License; they are outside its scope. The act of running a program using the Library is not restricted, and output from such a program is covered only if its contents constitute a work based on the Library (independent of the use of the Library in a tool for writing it). Whether that is true depends on what the Library does and what the program that uses the Library does.

1. You may copy and distribute verbatim copies of the Librarys complete source code as you receive it, in any medium, provided that you conspicuously and appropriately publish on each copy an appropriate copyright notice and disclaimer of warranty; keep intact all the notices that refer to this License and to the absence of any warranty; and distribute a copy of this License along with the Library.

You may charge a fee for the physical act of transferring a copy, and you may at your option offer warranty protection in exchange for a fee.

2. You may modify your copy or copies of the Library or any portion of it, thus forming a work based on the Library, and copy and distribute such modifications or work under the terms of Section 1 above, provided that you also meet all of these conditions

   a. The modified work must itself be a software library.
   b. You must cause the files modified to carry prominent notices stating that you changed the files and the date of any change.
   c. You must cause the whole of the work to be licensed at nocharge to all third parties under the terms of this License.
   d. If a facility in the modified Library refers to a function or a table of data to be supplied by an appropriate program that uses the facility, other than as an argument passed when the facility is invoked, then you must make a good faith effort to ensure that, in the event an application does not supply such function or table, the facility still operates, and performs whatever part of its purpose remains meaningful.

(For example, a function in a library to compute square roots has a purpose that is entirely well-defined independent of the application. Therefore, Subsection 2d requires that any application-supplied function or table used by this function must be optional: if the application does not supply it, the square root function must still compute square roots.)

These requirements apply to the modified work as a whole. If identifiable sections of that work are not derived from the Library, and can be reasonably considered independent and separate works in themselves, then this License, and its terms, do not apply to those sections when you distribute them as separate works. But when you distribute the same sections as part of a whole which is a work based on the Library, the distribution of the whole must be on the terms of this License, whose permissions for other licensees extend to the entire whole, and thus to each and every part regardless of who wrote it.

Thus, it is not the intent of this section to claim rights or contest your rights to work written entirely by you; rather, the intent is to exercise the right to control the distribution of derivative or collective works based on the Library.

In addition, mere aggregation of another work not based on the Library with the Library (or with a work based on the Library) on a volume of a storage or distribution medium does not bring the other work under the scope of this License.

3. You may opt to apply the terms of the ordinary GNU General Public License instead of this License to a given copy of the Library. To do this, you must alter all the notices that refer to this License, so that they refer to the ordinary GNU General Public License, version 2, instead of to this License. (If a newer version than version 2 of the ordinary GNU General Public License has appeared, then you can
4. You may copy and distribute the Library (or a portion or derivative of it, under Section 2) in object code or executable form under the terms of Sections 1 and 2 above provided that you accompany it with the complete corresponding machine-readable source code, which must be distributed under the terms of Sections 1 and 2 above on a medium customarily used for software interchange. If distribution of object code is made by offering access to copy from a designated place, then offering equivalent access to copy the source code from the same place satisfies the requirement to distribute the source code, even though third parties are not compelled to copy the source code along with the object code.

5. A program that contains no derivative of any portion of the Library, but is designed to work with the Library by being compiled or linked with it, is called a "work that uses the Library". Such a work, in isolation, is not a derivative work of the Library, and therefore falls outside the scope of this License.

However, linking a "work that uses the Library" with the Library creates an executable that is a derivative of the Library (because it contains portions of the Library), rather than a "work that uses the library". The executable is therefore covered by this License. Section 6 states terms for distribution of such executables.

When a "work that uses the Library" uses material from a header file that is part of the Library, the object code for the work may be a derivative work of the Library even though the source code is not. Whether this is true is especially significant if the work can be linked without the Library, or if the work is itself a library. The threshold for this to be true is not precisely defined by law.

If such an object file uses only numerical parameters, data structure layouts and accessors, and small macros and small inline functions (ten lines or less in length), then the use of the object file is unrestricted, regardless of whether it is legally a derivative work. (Executables containing this object code plus portions of the Library will still fall under Section 6.)

Otherwise, if the work is a derivative of the Library, you may distribute the object code for the work under the terms of Section 6. Any executables containing that work also fall under Section 6, whether or not they are linked directly with the Library itself.

6. As an exception to the Sections above, you may also combine or link a "work that uses the Library" with the Library to produce a work containing portions of the Library, and distribute that work under terms of your choice, provided that the terms permit modification of the work for the customers own use and reverse engineering for debugging such modifications.

You must give prominent notice with each copy of the work that the Library is used in it and that the Library and its use are covered by this License. You must supply a copy of this License. If the work during execution displays copyright notices, you must include the copyright notice for the Library among them, as well as a reference directing the user to the copy of this License. Also, you must do one of the following things:

a. Accompany the work with the complete corresponding machine-readable source code for the Library including whatever changes were used in the work (which must be distributed under Sections 1 and 2 above); and, if the work is an executable linked with the Library, with the complete machine-readable "work that uses the Library", as object code and/or source code, so that the user can manage the Library and then relink to produce a modified executable containing the modified Library. (It is understood that the user who changes the contents of definitions files in the Library will not necessarily be able to recompile the application to use the modified definitions.)

b. Use a suitable shared library mechanism for linking with the Library. A suitable mechanism is one that (1) uses at run time a copy of the library already present on the users computer system, rather than copying library functions into the executable, and (2) will operate properly with a modified version of the library, if the user installs one, as long as the modified version is interface-compatible with the version that the work was made with.

c. Accompany the work with a written offer, valid for at least three years, to give the same user the materials specified in Subsection 6a, above, for a charge no more than the cost of performing this distribution.

d. If distribution of the work is made by offering access to copy from a designated place, offer equivalent access to copy the above specified materials from the same place.

e. Verify that the user has already received a copy of these materials or that you have already sent this user a copy.

For an executable, the required form of the "work that uses the Library" must include any data and utility programs needed for reproducing the executable from it. However, as a special exception, the materials to be distributed need not include anything that is normally distributed (in either source or binary form) with the major components (compiler, kernel, and so on) of the operating system on which the executable runs, unless that component itself accompanies the executable.

It may happen that this requirement contradicts the license restrictions of other proprietary libraries that do not normally accompany the operating system. Such a contradiction means you cannot use both them and the Library together in an executable that you distribute.

7. You may place library facilities that are a work based on the Library side-by-side in a single library together with other library facilities not covered by this License, and distribute such a combined library, provided that the separate distribution of the work based on the Library and of the other library facilities is otherwise permitted, and provided that you do these two things:

a. Accompany the combined library with a copy of the same work based on the Library, uncombined with any other library facilities.

b. Give prominent notice with the combined library of the fact that part of it is a work based on the Library, and explaining where to find the accompanying uncombined form of the same work.

8. You may not copy, modify, sublicense, link with, or distribute the Library except as expressly provided under this License. Any attempt otherwise to copy, modify, sublicense, link with, or distribute the Library is void, and will automatically terminate your rights under this License. However, parties who have received copies, or rights, from you under this License will not have their licenses terminated so long as such parties remain in full compliance.

9. You are not required to accept this License, since you have not signed it. However, nothing else grants you permission to modify or distribute the Library or its derivative works. These actions are prohibited by law if you do not accept this License. Therefore, by modifying or distributing the Library (or any work based on the Library), you indicate your acceptance of this License to do so, and all its terms and conditions for copying, distributing or modifying the Library or works based on it.

10. Each time you redistribute the Library (or any work based on the Library), the recipient automatically receives a license from the original licensor to copy, redistribute, link with or modify the Library subject to these terms and conditions. You may not impose any further restrictions on the recipients exercise of the rights granted herein. You are not responsible for enforcing compliance by third parties with this License.

11. If, as a consequence of a court judgment or allegation of patent infringement or for any other reason (not limited to patent issues),
DISTRIBUTION

Apache Software License, Version 2.0

Copyright (c) 2004 The Apache Software Foundation. All rights reserved. TERMS AND CONDITIONS FOR USE, REPRODUCTION, AND DISTRIBUTION

1. Definitions.

"License" shall mean the terms and conditions for use, reproduction, and distribution as defined by Sections 1 through 9 of this document.

"Licensors" shall mean the copyright owner or entity authorized by the copyright owner that is granting the License.

"Legal Entity" shall mean the union of the acting entity and all other entities that control, are controlled by, or are under common control with that entity.

For the purposes of this definition, "control" means (i) the power, direct or indirect, to cause the direction or management of such entity, whether by contract or otherwise, or (ii) ownership of fifty percent (50%) or more of the outstanding shares, or (iii) beneficial ownership of such entity.

"You" (or "Your") shall mean an individual or Legal Entity exercising permissions granted by this License.

"Source" form shall mean the preferred form for making modifications, including but not limited to software source code, documentation source, and configuration files.

"Object" form shall mean any form resulting from mechanical transformation or translation of a Source form, including but not limited to compiled object code, generated documentation, and conversions to other media types.

"Work" shall mean the work of authorship, whether in Source or Object form, made available under the License, as indicated by a copyright notice that is included in or attached to the work (an example is provided in the Appendix below).

END OF TERMS AND CONDITIONS

Apache Software License, Version 2.0

Copyright (c) 2004 The Apache Software Foundation. All rights reserved. TERMS AND CONDITIONS FOR USE, REPRODUCTION, AND DISTRIBUTION

1. Definitions.

"License" shall mean the terms and conditions for use, reproduction, and distribution as defined by Sections 1 through 9 of this document.

"Licensors" shall mean the copyright owner or entity authorized by the copyright owner that is granting the License.

"Legal Entity" shall mean the union of the acting entity and all other entities that control, are controlled by, or are under common control with that entity. For the purposes of this definition, "control" means (i) the power, direct or indirect, to cause the direction or management of such entity, whether by contract or otherwise, or (ii) ownership of fifty percent (50%) or more of the outstanding shares, or (iii) beneficial ownership of such entity.

"You" (or "Your") shall mean an individual or Legal Entity exercising permissions granted by this License.

"Source" form shall mean the preferred form for making modifications, including but not limited to software source code, documentation source, and configuration files.

"Object" form shall mean any form resulting from mechanical transformation or translation of a Source form, including but not limited to compiled object code, generated documentation, and conversions to other media types.

"Work" shall mean the work of authorship, whether in Source or Object form, made available under the License, as indicated by a copyright notice that is included in or attached to the work (an example is provided in the Appendix below).
“Derivative Works” shall mean any work, whether in Source or Object form, that is based on (or derived from) the Work and for which the editorial revisions, annotations, elaborations, or other modifications represent, as a whole, an original work of authorship. For the purposes of this License, Derivative Works shall not include works that remain separable from, or merely link (or bind by name) to the interfaces of, the Work and Derivative Works thereof.

"Contribution" shall mean any work of authorship, including the original version of the Work and any modifications or additions to that Work or Derivative Works thereof, that is intentionally submitted for inclusion in the Work by the copyright owner or by an individual or Legal Entity authorized to submit on behalf of the copyright owner. For the purposes of this definition, "submitted" means any form of electronic, verbal, or written communication sent to the Licensor or its representatives, including but not limited to communication on electronic mailing lists, source code control systems, and issue tracking systems that are managed by, or on behalf of, the Licensor for the purpose of discussing and improving the Work, but excluding communication that is conspicuously marked or otherwise designated in writing by the copyright owner as "Not a Contribution."

"Contributor" shall mean Licensor and any individual or Legal Entity on behalf of whom a Contribution has been received by Licensor and subsequently incorporated into the Work.

2. Grant of Copyright License. Subject to the terms and conditions of this License, each Contributor hereby grants to You a perpetual, worldwide, non-exclusive, no-charge, royalty-free, irrevocable copyright license to reproduce, prepare Derivative Works of, publicly display, publicly perform, sublicense, and distribute the Work and such Derivative Works in Source or Object form.

3. Grant of Patent License. Subject to the terms and conditions of this License, each Contributor hereby grants to You a perpetual, worldwide, non-exclusive, no-charge, royalty-free, irrevocable (except as stated in this section) patent license to make, have made, use, offer to sell, sell, import, and otherwise transfer the Work, where such license applies only to those patent claims licensable by such Contributor that are necessarily infringed by their Contribution(s) alone or by combination of their Contribution(s) with the Work to which such Contribution(s) was submitted. If You institute patent litigation against any entity (including a cross-claim or counterclaim in a lawsuit) alleging that the Work or a Contribution incorporated within the Work constitutes direct or contributory patent infringement, then any patent licenses granted to You under this License for that Work shall terminate as of the date such litigation is filed.

4. Redistribution. You may reproduce and distribute copies of the Work or Derivative Works thereof in any medium, with or without modifications, and in Source or Object form, provided that You meet the following conditions:

   a. You must give any other recipients of the Work or Derivative Works a copy of this License; and
   b. You must cause any modified files to carry prominent notices stating that You changed the files; and
   c. You must retain, in the Source form of any Derivative Works that You distribute, all copyright, patent, trademark, and attribution notices from the Source form of the Work, excluding those notices that do not pertain to any part of the Derivative Works; and
   d. If the Work includes a "NOTICE" text file as part of its distribution, then any Derivative Works that You distribute must include a readable copy of the attribution notices contained within such NOTICE file, excluding those notices that do not pertain to any part of the Derivative Works, in at least one of the following places: within a NOTICE text file distributed as part of the Derivative Works; within the Source form or documentation, if provided along with the Derivative Works; or, within a display generated by the Derivative Works, if and wherever such third-party notices normally appear. The contents of the NOTICE file are for informational purposes only and do not modify the License. You may add Your own attribution notices within Derivative Works that You distribute, alongside or as an addendum to the NOTICE text from the Work, provided that such additional attribution notices cannot be construed as modifying the License.

You may add Your own copyright statement to Your modifications and may provide additional or different license terms and conditions for use, reproduction, or distribution of Your modifications, or for any such Derivative Works as a whole, provided Your use, reproduction, and distribution of the Work otherwise complies with the conditions stated in this License.

5. Submission of Contributions. Unless You explicitly state otherwise, any Contribution intentionally submitted for inclusion in the Work by You to the Licensor shall be under the terms and conditions of this License, without any additional terms or conditions. Notwithstanding the above, nothing herein shall supersede or modify the terms of any separate license agreement you may have executed with Licensor regarding such Contributions.

6. Trademarks. This License does not grant permission to use the trade names, trademarks, service marks, or product names of the Licensor, except as required for reasonable and customary use in describing the origin of the Work and reproducing the content of the NOTICE file.

7. Disclaimer of Warranty. Unless required by applicable law or agreed to in writing, Licensor provides the Work (and each Contributor provides its Contributions) on an "AS IS" BASIS, WITHOUT WARRANTIES OR CONDITIONS OF ANY KIND, either express or implied, including, without limitation, any warranties or conditions of TITLE, NON-INFRINGEMENT, MERCHANTABILITY, or FITNESS FOR A PARTICULAR PURPOSE. You are solely responsible for determining the appropriateness of using or redistributing the Work and assume any risks associated with Your exercise of permissions under this License.

8. Limitation of Liability. In no event and under no legal theory, whether in tort (including negligence), contract, or otherwise, unless required by applicable law (such as deliberate and grossly negligent acts) or agreed to in writing, shall any Contributor be liable to You for damages, including any direct, indirect, special, incidental, or consequential damages of any character arising as a result of this License or out of the use or inability to use the Work (including but not limited to damages for loss of goodwill, work stoppage, computer failure or malfunction, or any and all other commercial damages or losses), even if such Contributor has been advised of the possibility of such
9. Accepting Warranty or Additional Liability. While redistributing the Work or Derivative Works thereof, You may choose to offer, and charge a fee for, acceptance of support, warranty, indemnity, or other liability obligations and/or rights consistent with this License. However, in accepting such obligations, You may act only on Your own behalf and on Your sole responsibility, not on behalf of any other Contributor, and only if You agree to indemnify, defend, and hold each Contributor harmless for any liability incurred by, or claims asserted against, such Contributor by reason of your accepting any such warranty or additional liability.

END OF TERMS AND CONDITIONS

APPENDIX: How to apply the Apache License to your work.

To apply the Apache License to your work, attach the following boilerplate notice, with the fields enclosed by brackets "[]" replaced with your own identifying information. (Don't include the brackets!) The text should be enclosed in the appropriate comment syntax for the file format. We also recommend that a file or class name and description of purpose be included on the same "printed page" as the copyright notice for easier identification within third-party archives.

Copyright [yyyy] [name of copyright owner]
Licensed under the Apache License, Version 2.0 (the "License"); you may not use this file except in compliance with the License. You may obtain a copy of the License at

http://www.apache.org/licenses/LICENSE-2.0

Unless required by applicable law or agreed to in writing, software distributed under the License is distributed on an "AS IS" BASIS, WITHOUT WARRANTIES OR CONDITIONS OF ANY KIND, either express or implied. See the License for the specific language governing permissions and limitations under the License.

perl Artistic License

The "Artistic License"

Preamble

The intent of this document is to state the conditions under which a Package may be copied, such that the Copyright Holder maintains some semblance of artistic control over the development of the package, while giving the users of the package the right to use and distribute the Package in a more-or-less customary fashion, plus the right to make reasonable modifications.

Definitions:

"Package" refers to the collection of files distributed by the Copyright Holder, and derivatives of that collection of files created through textual modification.

"Standard Version" refers to such a Package if it has not been modified, or has been modified in accordance with the wishes of the Copyright Holder as specified below.

"Copyright Holder" is whoever is named in the copyright or copyrights for the package.

"You" is you, if you're thinking about copying or distributing this Package.

"Reasonable copying fee" is whatever you can justify on the basis of media cost, duplication charges, time of people involved, and so on. (You will not be required to justify it to the Copyright Holder, but only to the computing community at large as a market that must bear the fee.)

"Freely Available" means that no fee is charged for the item itself, though there may be fees involved in handling the item. It also means that recipients of the item may redistribute it under the same conditions they received it.

1. You may make and give away verbatim copies of the source form of the Standard Version of this Package without restriction, provided that you duplicate all of the original copyright notices and associated disclaimers.

2. You may apply bug fixes, portability fixes and other modifications derived from the Public Domain or from the Copyright Holder. A Package modified in such a way shall still be considered the Standard Version.

3. You may otherwise modify your copy of this Package in any way, provided that you insert a prominent notice in each changed file stating how and when you changed that file, and provided that you do at least ONE of the following:
   a. place your modifications in the Public Domain or otherwise make them Freely Available, such as by posting said modifications to Usenet or an equivalent medium, or placing the modifications on a major archive site such as uunet.uu.net, or by allowing the Copyright Holder to include your modifications in the Standard Version of the Package.
   b. use the modified Package only within your corporation or organization.
   c. rename any non-standard executables so the names do not conflict with standard executables, which must also be provided, and provide a separate manual page for each non-standard executable that clearly documents how it differs from the Standard Version.
   d. make other distribution arrangements with the Copyright Holder.

4. You may distribute the programs of this Package in object code or executable form, provided that you do at least ONE of the following:
   a. distribute a Standard Version of the executables and library files, together with instructions (in the manual page or equivalent) on where to get the Standard Version.
   b. accompany the distribution with the machine-readable source of the Package with your modifications.
c. give non-standard executables non-standard names, and clearly document the differences in manual pages (or equivalent), together with instructions on where to get the Standard Version.
d. make other distribution arrangements with the Copyright Holder.

5. You may charge a reasonable copying fee for any distribution of this Package. You may charge any fee you choose for support of this Package. You may not charge a fee for this Package itself. However, you may distribute this Package in aggregate with other (possibly commercial) programs as part of a larger (possibly commercial) software distribution provided that you do not advertise this Package as a product of your own. You may embed this Packages interpreter within an executable of yours (by linking); this shall be construed as a mere form of aggregation, provided that the complete Standard Version of the interpreter is so embedded.

6. The scripts and library files supplied as input to or produced as output from the programs of this Package do not automatically fall under the copyright of this Package, but belong to whoever generated them, and may be sold commercially, and may be aggregated with this Package. If such scripts or library files are aggregated with this Package via the so-called "undump" or "unexec" methods of producing a binary executable image, then distribution of such an image shall neither be construed as a distribution of this Package nor shall it fall under the restrictions of Paragraphs 3 and 4, provided that you do not represent such an executable image as a Standard Version of this Package.

7. C subroutines (or comparably compiled subroutines in other languages) supplied by you and linked into this Package in order to emulate subroutines and variables of the language defined by this Package shall not be considered part of this Package, but are the equivalent of input as in Paragraph 6, provided these subroutines do not change the language in any way that would cause it to fail the regression tests for the language.

8. Aggregation of this Package with a commercial distribution is always permitted provided that the use of this Package is embedded; that is, when no overt attempt is made to make this Packages interfaces visible to the end user of the commercial distribution. Such use shall not be construed as a distribution of this Package.

9. The name of the Copyright Holder may not be used to endorse or promote products derived from this software without specific prior written permission.

10. THIS PACKAGE IS PROVIDED "AS IS" AND WITHOUT ANY EXPRESS OR IMPLIED WARRANTIES, INCLUDING, WITHOUT LIMITATION, THE IMPLIED WARRANTIES OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE.

MIT Kerberos Copyright

Copyright Notice and Legal Administrivia

Copyright (C) 1985-2002 by the Massachusetts Institute of Technology. All rights reserved.

Export of this software from the United States of America may require a specific license from the United States Government. It is the responsibility of any person or organization contemplating export to obtain such a license before exporting.

WITHIN THAT CONSTRAINT, permission to use, copy, modify, and distribute this software and its documentation for any purpose and without fee is hereby granted, provided that the above copyright notice appear in all copies and that both that copyright notice and this permission notice appear in supporting documentation, and that the name of M.I.T. not be used in advertising or publicity pertaining to distribution of the software without specific, written prior permission. Furthermore if you modify this software you must label your software as modified software and not distribute it in such a fashion that it might be confused with the original MIT software.

M.I.T. makes no representations about the suitability of this software for any purpose. It is provided "as is" without express or implied warranty. THIS SOFTWARE IS PROVIDED "AS IS" AND WITHOUT ANY EXPRESS OR IMPLIED WARRANTIES, INCLUDING, WITHOUT LIMITATION, THE IMPLIED WARRANTIES OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE.

Individual source code files are copyright MIT, Cygnus Support, OpenVision, Oracle, Sun Soft, FundsXpress, and others.

Project Athena, Athena MUSE, Discuss, Hesiod, Kerberos, Moira, and Zephyr are trademarks of the Massachusetts Institute of Technology (MIT). No commercial use of these trademarks may be made without prior written permission of MIT.

"Commercial use" means use of a name in a product or other for-profit manner. It does NOT prevent a commercial firm from referring to the MIT trademarks in order to convey information (although in doing so, recognition of their trademark status should be given).

The following copyright and permission notice applies to the OpenVision Kerberos Administration system located in kadmin/create, kadmin/dbutil, kadmin/passwd, kadmin/server, lib/kadm5, and portions of lib/rpc:

Copyright, OpenVision Technologies, Inc., 1996. All Rights Reserved
WARNING: Retrieving the OpenVision Kerberos Administration system source code, as described below, indicates your acceptance of the following terms. If you do not agree to the following terms, do not retrieve the OpenVision Kerberos administration system.

You may freely use and distribute the Source Code and Object Code compiled from it, with or without modification, but this Source Code is provided to you "AS IS" EXCLUSIVE OF ANY WARRANTY, INCLUDING, WITHOUT LIMITATION, ANY WARRANTIES OF MERCHANTABILITY OR FITNESS FOR A PARTICULAR PURPOSE, OR ANY OTHER WARRANTY, WHETHER EXPRESS OR IMPLIED. IN NO EVENT WILL OPENVISION HAVE ANY LIABILITY FOR ANY LOST PROFITS, LOSS OF DATA OR COSTS OF PROCUREMENT OF SUBSTITUTE GOODS OR SERVICES, OR FOR ANY SPECIAL, INDIRECT, OR CONSEQUENTIAL DAMAGES ARISING OUT OF THIS AGREEMENT, INCLUDING, WITHOUT LIMITATION, THOSE RESULTING FROM THE USE OF THE SOURCE CODE, OR THE FAILURE OF THE SOURCE CODE TO PERFORM, OR FOR ANY OTHER REASON.

OpenVision retains all copyrights in the donated Source Code. OpenVision also retains copyright to derivative works of the Source Code, whether created by OpenVision or by a third party. The OpenVision copyright notice must be preserved if derivative works are made based on the donated Source Code.

OpenVision Technologies, Inc. has donated this Kerberos Administration system to MIT for inclusion in the standard Kerberos 5 distribution. This donation underscores our commitment to continuing Kerberos technology development and our gratitude for the valuable work which has been performed by MIT and the Kerberos community.

Portions contributed by Matt Crawford <crawdad@fnal.gov> were work performed at Fermi National Accelerator Laboratory, which is operated by Universities Research Association, Inc., under contract DE-AC02-76CH03000 with the U.S. Department of Energy.

"This product includes software developed by the OpenSSL Project for use in the OpenSSL Toolkit ([http://www.openssl.org/](http://www.openssl.org/))"
There are no restrictions on distributing an unmodified copy of Vim. Parts of Vim may also be distributed, but this text must always be included. You are allowed to include executables that you made from the unmodified Vim sources, your own usage examples and Vim scripts. If you distribute a modified version of Vim, you are encouraged to send the maintainer a copy, including the source code. Or make it available to the maintainer through ftp; let him know where it can be found. If the number of changes is small (e.g., a modified Makelife) e-mailing the diffs will do. When the maintainer asks for it (in any way) you must make your changes, including source code, available to him. The maintainer reserves the right to include any changes in the official version of Vim. This is negotiable. You are not allowed to distribute a modified version of Vim when you are not willing to make the source code available to the maintainer. The current maintainer is Bram Moolenaar <Bram@vim.org>. If this changes, it will be announced in appropriate places (most likely www.vim.org and comp.editors). When it is completely impossible to contact the maintainer, the obligation to send him modified source code ceases. It is not allowed to remove these restrictions from the distribution of the Vim sources or parts of it. These restrictions may also be used for previous Vim releases instead of the text that was included with it. Vim is Charityware. You can use and copy it as much as you like, but you are encouraged to make a donation for needy children in Uganda. Please see |kcc| below or visit the ICCF web site, available at these mirrors: http://www.vim.org/iccf/ http://www.iccf.nl/ The Open Publication License applies to the Vim documentation, see | manual - copyright |.

--- begin of license ---

VIM LICENSE

There are no restrictions on distributing unmodified copies of Vim except that they must include this license text. You can also distribute unmodified parts of Vim, likewise unrestricted except that they must include this license text. You are also allowed to include executables that you made from the unmodified Vim sources, your own usage examples and Vim scripts. It is allowed to distribute a modified (or extended) version of Vim, including executables and/or source code, when the following four conditions are met:

1. This license text must be included unmodified.
2. The modified Vim must be distributed in one of the following five ways:
   a. If you make changes to Vim yourself, you must clearly describe in the distribution how to contact you. When the maintainer asks you (in any way) for a copy of the modified Vim you distributed, you must make your changes, including source code, available to the maintainer without fee. The maintainer reserves the right to include your changes in the official version of Vim. What the maintainer will do with your changes and under what license they will be distributed is negotiable. If there has been no negotiation then this license, or a later version, also applies to your changes. The current maintainer is Bram Moolenaar <Bram @vim.org>. If this changes it will be announced in appropriate places (most likely vim.sf.net, www.vim.org and/or comp.editors). When it is completely impossible to contact the maintainer, the obligation to send him your changes ceases. Once the maintainer has confirmed that he has received your changes they will not have to be sent again.
   b. If you have received a modified Vim that was distributed as mentioned under a) you are allowed to further distribute it unmodified, as mentioned at I). If you make additional changes the text under a) applies to those changes.
   c. Provide all the changes, including source code, with every copy of the modified Vim you distribute. This may be done in the form of a context diff. You can choose what license to use for new code you add. The changes and their license must not restrict others from making their own changes to the official version of Vim.
   d. When you have a modified Vim which includes changes as mentioned under c), you can distribute it without the source code for the changes if the following three conditions are met:
      - The license that applies to the changes permits you to distribute the changes to the Vim maintainer without fee or restriction, and permits the Vim maintainer to include the changes in the official version of Vim without fee or restriction.
      - You keep the changes for at least three years after last distributing the corresponding modified Vim. When the maintainer or someone who you distributed the modified Vim to asks you (in any way) for the changes within this period, you must make them available to him.
      - You clearly describe in the distribution how to contact you. This contact information must remain valid for at least three years after last distributing the corresponding modified Vim, or as long as possible.
   e. When the GNU General Public License (GPL) applies to the changes, you can distribute the modified Vim under the GNU GPL version 2 or any later version.
3. A message must be added, at least in the output of the :version command and in the intro screen, such that the user of the modified Vim is able to see that it was modified. When distributing as mentioned under 2)e) adding the message is only required for as far as this does not conflict with the license used for the changes.
4. The contact information as required under 2)a) and 2)d) must not be removed or changed, except that the person himself can make corrections.
If you distribute a modified version of Vim, you are encouraged to use the Vim license for your changes and make them available to the maintainer, including the source code.

The preferred way to do this is by e-mail or by uploading the files to a server and e-mailing the URL. If the number of changes is small (e.g., a modified Makefile) e-mailing a context diff will do. The e-mail address to be used is <maintainer@vim.org>

It is not allowed to remove this license from the distribution of the Vim sources, parts of it or from a modified version. You may use this license for previous Vim releases instead of the license that they came with, at your option.

--- end of license ---

**ZLIB License**

(C) 1995-2002 Jean-loup Gailly and Mark Adler

This software is provided as-is, without any express or implied warranty. In no event will the authors be held liable for any damages arising from the use of this software.

Permission is granted to anyone to use this software for any purpose, including commercial applications, and to alter it and redistribute it freely, subject to the following restrictions:

The origin of this software must not be misrepresented; you must not claim that you wrote the original software. If you use this software in a product, an acknowledgment in the product documentation would be appreciated but is not required.

Altered source versions must be plainly marked as such, and must not be misrepresented as being the original software.

This notice may not be removed or altered from any source distribution.

Jean-loup Gailly Mark Adler
jloup@gzip.org madler@alumni.caltech.edu

If you use the zlib library in a product, we would appreciate not receiving lengthy legal documents to sign. The sources are provided for free but without warranty of any kind. The library has been entirely written by Jean-loup Gailly and Mark Adler; it does not include third-party code.

If you redistribute modified sources, we would appreciate that you include in the file ChangeLog history information documenting your changes.

**ECLIPSE SOFTWARE**

The product includes Eclipse software (the "Eclipse Program") provided by the Eclipse Foundation and licensed to Infoblox Inc. under the Eclipse Public License v1.0.

EXCEPT AS EXPRESSLY SET FORTH IN THE ECLIPSE PUBLIC LICENSE, THE ECLIPSE PROGRAM IS PROVIDED ON AN "AS IS" BASIS, WITHOUT WARRANTIES OR CONDITIONS OF ANY KIND, EITHER EXPRESS OR IMPLIED INCLUDING, WITHOUT LIMITATION, ANY WARRANTIES OR CONDITIONS OF TITLE, NON-INFRINGEMENT, MERCHANTABILITY OR FITNESS FOR A PARTICULAR PURPOSE. EXCEPT AS EXPRESSLY SET FORTH IN THE ECLIPSE PUBLIC LICENSE, NEITHER THE ECLIPSE FOUNDATION NOR ANY CONTRIBUTORS TO THE ECLIPSE PROGRAM SHALL HAVE ANY LIABILITY FOR ANY DIRECT, INDIRECT, INCIDENTAL, SPECIAL, EXEMPLARY, OR CONSEQUENTIAL DAMAGES (INCLUDING WITHOUT LIMITATION LOST PROFITS), HOWEVER CAUSED AND ON ANY THEORY OF LIABILITY, WHETHER IN CONTRACT, STRICT LIABILITY, OR TORT (INCLUDING NEGLIGENCE OR OTHERWISE) ARISING IN ANY WAY OUT OF THE USE OF THE ECLIPSE PROGRAM, EVEN IF ADVISED OF THE POSSIBILITY OF SUCH DAMAGES.

Any provisions provided by Infoblox relating to the Eclipse Program which differ from the above terms or the Eclipse Public License are offered by Infoblox alone and not by any other party.

The source code for the Eclipse Program is available from Infoblox as described in the open source introduction.

**Eclipse Public License - v 1.0**

THE ACCOMPANYING PROGRAM IS PROVIDED UNDER THE TERMS OF THIS ECLIPSE PUBLIC LICENSE ("AGREEMENT"). ANY USE, REPRODUCTION OR DISTRIBUTION OF THE PROGRAM CONSTITUTES RECIPIENT'S ACCEPTANCE OF THIS AGREEMENT.

1. DEFINITIONS

"Contribution" means:

a) in the case of the initial Contributor, the initial code and documentation distributed under this Agreement, and

b) in the case of each subsequent Contributor:

i) changes to the Program, and

ii) additions to the Program;

where such changes and/or additions to the Program originate from and are distributed by that particular Contributor. A Contribution `originates` from a Contributor if it was added to the Program by such Contributor itself or anyone acting on such Contributor's behalf. Contributions do not include additions to the Program which: (i) are separate modules of software distributed in conjunction with the Program under their own license agreement, and (ii) are not derivative works of the Program.

"Contributor" means any person or entity that distributes the Program.
"Licensed Patents" mean patent claims licensable by a Contributor which are necessarily infringed by the use or sale of its Contribution alone or when combined with the Program.

"Program" means the Contributions distributed in accordance with this Agreement.

"Recipient" means anyone who receives the Program under this Agreement, including all Contributors.

2. GRANT OF RIGHTS

a) Subject to the terms of this Agreement, each Contributor hereby grants Recipient a non-exclusive, worldwide, royalty-free copyright license to reproduce, prepare derivative works of, publicly display, publicly perform, distribute and sublicense the Contribution of such Contributor, if any, and such derivative works, in source code and object code form.

b) Subject to the terms of this Agreement, each Contributor hereby grants Recipient a non-exclusive, worldwide, royalty-free patent license under Licensed Patents to make, use, sell, offer to sell, import and otherwise transfer the Contribution of such Contributor, if any, in source code and object code form. This patent license shall apply to the combination of the Contribution and the Program if, at the time the Contribution is added by the Contributor, such addition of the Contribution causes such combination to be covered by the Licensed Patents. The patent license shall not apply to any other combinations which include the Contribution. No hardware per se is licensed hereunder.

c) Recipient understands that although each Contributor grants the licenses to its Contributions set forth herein, no assurances are provided by any Contributor that the Program does not infringe the patent or other intellectual property rights of any other entity. Each Contributor disclaims any liability to Recipient for claims brought by any other entity based on infringement of intellectual property rights or otherwise. As a condition to exercising the rights and licenses granted hereunder, each Recipient hereby assumes sole responsibility to secure any other intellectual property rights needed, if any. For example, if a third party patent license is required to allow Recipient to distribute the Program, it is Recipient's responsibility to acquire that license before distributing the Program.

d) Each Contributor represents that to its knowledge it has sufficient copyright rights in its Contribution, if any, to grant the copyright license set forth in this Agreement.

3. REQUIREMENTS

A Contributor may choose to distribute the Program in object code form under its own license agreement, provided that:

a) it complies with the terms and conditions of this Agreement; and

b) its license agreement:

i) effectively disclaims on behalf of all Contributors all warranties and conditions, express and implied, including warranties or conditions of title and non-infringement, and implied warranties or conditions of merchantability and fitness for a particular purpose;

ii) effectively excludes on behalf of all Contributors all liability for damages, including direct, indirect, special, incidental and consequential damages, such as lost profits;

iii) states that any provisions which differ from this Agreement are offered by that Contributor alone and not by any other party; and

iv) states that source code for the Program is available from such Contributor, and informs licensees how to obtain it in a reasonable manner on or through a medium customarily used for software exchange.

When the Program is made available in source code form:

a) it must be made available under this Agreement; and

b) a copy of this Agreement must be included with each copy of the Program.

Contributors may not remove or alter any copyright notices contained within the Program.

Each Contributor must identify itself as the originator of its Contribution, if any, in a manner that reasonably allows subsequent Recipients to identify the originator of the Contribution.

4. COMMERCIAL DISTRIBUTION

Commercial distributors of software may accept certain responsibilities with respect to end users, business partners and the like. While this license is intended to facilitate the commercial use of the Program, the Contributor who includes the Program in a commercial product offering should do so in a manner which does not create potential liability for other Contributors. Therefore, if a Contributor includes the Program in a commercial product offering, such Contributor ("Commercial Contributor") hereby agrees to defend and indemnify every other Contributor ("Indemnified Contributor") against any losses, damages and costs (collectively "Losses") arising from claims, lawsuits and other legal actions brought by a third party against the Indemnified Contributor to the extent caused by the acts or omissions of such Commercial Contributor in connection with its distribution of the Program in a commercial product offering. The obligations in this section do not apply to any claims or Losses relating to any actual or alleged intellectual property infringement. In order to qualify, an Indemnified Contributor must:

a) promptly notify the Commercial Contributor in writing of such claim, and b) allow the Commercial Contributor to control, and cooperate with the Commercial Contributor in, the defense and any related settlement negotiations. The Indemnified Contributor may participate in any such claim at its own expense.

For example, a Contributor might include the Program in a commercial product offering, Product X. That Contributor is then a Commercial Contributor. If that Commercial Contributor then makes performance claims, or offers warranties related to Product X, those performance claims and warranties are such Commercial Contributor's responsibility alone. Under this section, the Commercial Contributor would have to defend
claims against the other Contributors related to those performance claims and warranties, and if a court requires any other Contributor to pay any damages as a result, the Commercial Contributor must pay those damages.

5. NO WARRANTY

EXCEPT AS EXPRESSLY SET FORTH IN THIS AGREEMENT, THE PROGRAM IS PROVIDED ON AN "AS IS" BASIS, WITHOUT WARRANTIES OR CONDITIONS OF ANY KIND, EITHER EXPRESS OR IMPLIED INCLUDING, WITHOUT LIMITATION, ANY WARRANTIES OR CONDITIONS OF TITLE, NON-INFRINGEMENT, MERCHANTABILITY OR FITNESS FOR A PARTICULAR PURPOSE. Each Recipient is solely responsible for determining the appropriateness of using and distributing the Program and assumes all risks associated with its exercise of rights under this Agreement, including but not limited to the risks and costs of program errors, compliance with applicable laws, damage to or loss of data, programs or equipment, and unavailability or interruption of operations.

6. DISCLAIMER OF LIABILITY

EXCEPT AS EXPRESSLY SET FORTH IN THIS AGREEMENT, NEITHER RECIPIENT NOR ANY CONTRIBUTORS SHALL HAVE ANY LIABILITY FOR ANY DIRECT, INDIRECT, INCIDENTAL, SPECIAL, EXEMPLARY, OR CONSEQUENTIAL DAMAGES (INCLUDING WITHOUT LIMITATION LOST PROFITS), HOWEVER CAUSED AND ON ANY THEORY OF LIABILITY, WHETHER IN CONTRACT, STRICT LIABILITY, OR TORT (INCLUDING NEGLIGENCE OR OTHERWISE) ARISING IN ANY WAY OUT OF THE USE OR DISTRIBUTION OF THE PROGRAM OR THE EXERCISE OF ANY RIGHTS GRANTED HEREUNDER, EVEN IF ADVISED OF THE POSSIBILITY OF SUCH DAMAGES.

7. GENERAL

If any provision of this Agreement is invalid or unenforceable under applicable law, it shall not affect the validity or enforceability of the remainder of the terms of this Agreement, and without further action by the parties hereto, such provision shall be reformed to the minimum extent necessary to make such provision valid and enforceable.

If Recipient institutes patent litigation against any entity (including a cross-claim or counterclaim in a lawsuit) alleging that the Program itself (excluding combinations of the Program with other software or hardware) infringes such Recipient's patent(s), then such Recipient's rights granted under Section 2(b) shall terminate as of the date such litigation is filed.

All Recipient's rights under this Agreement shall terminate if it fails to comply with any of the material terms or conditions of this Agreement and does not cure such failure in a reasonable period of time after becoming aware of such noncompliance. If all Recipient's rights under this Agreement terminate, Recipient agrees to cease use and distribution of the Program as soon as reasonably practicable. However, Recipient's obligations under this Agreement and any licenses granted by Recipient relating to the Program shall continue and survive.

Everyone is permitted to copy and distribute copies of this Agreement, but in order to avoid inconsistency the Agreement is copyrighted and may only be modified in the following manner. The Agreement Steward reserves the right to publish new versions (including revisions) of this Agreement from time to time. No one other than the Agreement Steward has the right to modify this Agreement. The Eclipse Foundation is the initial Agreement Steward. The Eclipse Foundation may assign the responsibility to serve as the Agreement Steward to a suitable separate entity. Each new version of the Agreement will be given a distinguishing version number. The Program (including Contributions) may always be distributed subject to the version of the Agreement under which it was received. In addition, after a new version of the Agreement is published, Contributor may elect to distribute the Program (including its Contributions) under the new version. Except as expressly stated in Sections 2(a) and 2(b) above, Recipient receives no rights or licenses to the intellectual property of any Contributor under this Agreement, whether expressly, by implication, estoppel or otherwise. All rights in the Program not expressly granted under this Agreement are reserved.

This Agreement is governed by the laws of the State of New York and the intellectual property laws of the United States of America. No party to this Agreement will bring a legal action under this Agreement more than one year after the cause of action arose. Each party waives its rights to a jury trial in any resulting litigation.

GNU General Public License, version 2, with the Classpath Exception

The GNU General Public License (GPL) Version 2, June 1991

Copyright (C) 1989, 1991 Free Software Foundation, Inc.
59 Temple Place, Suite 330, Boston, MA 02111-1307 USA

Everyone is permitted to copy and distribute verbatim copies of this license document, but changing it is not allowed.

Preamble

The licenses for most software are designed to take away your freedom to share and change it. By contrast, the GNU General Public License is intended to guarantee your freedom to share and change free software--to make sure the software is free for all its users. This General Public License

Copyright ©2019, Infoblox, Inc. All right reserved.
License applies to most of the Free Software Foundation's software and to any other program whose authors commit to using it. (Some other Free Software Foundation software is covered by the GNU Library General Public License instead.) You can apply it to your programs, too. When we speak of free software, we are referring to freedom, not price. Our General Public Licenses are designed to make sure that you have the freedom to distribute copies of free software (and charge for this service if you wish), that you receive source code or can get it if you want it, that you can change the software or use pieces of it in new free programs; and that you know you can do these things. To protect your rights, we need to make restrictions that forbid anyone to deny you these rights or to ask you to surrender the rights. These restrictions translate to certain responsibilities for you if you distribute copies of the software, or if you modify it.

For example, if you distribute copies of such a program, whether gratis or for a fee, you must give the recipients all the rights that you have. You must make sure that they, too, receive or can get the source code. And you must show them these terms so they know their rights.

We protect your rights with two steps: (1) copyright the software, and (2) offer you this license which gives you legal permission to copy, distribute and/or modify the software.

Also, for each author's protection and ours, we want to make certain that everyone understands that there is no warranty for this free software. If the software is modified by someone else and passed on, we want its recipients to know that what they have is not the original, so that any problems introduced by others will not reflect on the original authors' reputations.

Finally, any free program is threatened constantly by software patents. We wish to avoid the danger that redistributors of a free program will individually obtain patent licenses, in effect making the program proprietary. To prevent this, we have made it clear that any patent must be licensed for everyone's free use or not licensed at all. The precise terms and conditions for copying, distribution and modification follow.

TERMS AND CONDITIONS FOR COPYING, DISTRIBUTION AND MODIFICATION

0. This License applies to any program or other work which contains a notice placed by the copyright holder saying it may be distributed under the terms of this General Public License.The "Program", below, refers to any such program or work, and a "work based on the Program" means either the Program or any derivative work under copyright law: that is to say, a work containing the Program or a portion of it, either verbatim or with modifications and/or translated into another language. (Hereinafter, translation is included without limitation in the term "modification".) Each licensee is addressed as "you".

Activities other than copying, distribution and modification are not covered by this License; they are outside its scope. The act of running the Program is not restricted, and the output from the Program is covered only if its contents constitute a work based on the Program (independent of having been made by running the Program). Whether that is true depends on what the Program does.

1. You may copy and distribute verbatim copies of the Program's source code as you receive it, in any medium, provided that you conspicuously and appropriately publish on each copy an appropriate copyright notice and disclaimer of warranty; keep intact all the notices that refer to this License and to the absence of any warranty; and give any other recipients of the Program a copy of this License along with the Program.

You may charge a fee for the physical act of transferring a copy, and you may at your option offer warranty protection in exchange for a fee.

2. You may modify your copy or copies of the Program or any portion of it, thus forming a work based on the Program, and copy and distribute such modifications or work under the terms of Section 1 above, provided that you also meet all of these conditions:
   a. You must cause the modified files to carry prominent notices stating that you changed the files and the date of any change.
   b. You must cause any work that you distribute or publish, that in whole or in part contains or is derived from the Program or any part thereof, to be licensed as a whole at no charge to all third parties under the terms of this License.
   c. If the modified program normally reads commands interactively when run, you must cause it, when started running for such interactive use in the most ordinary way, to print or display an announcement including an appropriate copyright notice and a notice that there is no warranty (or else, saying that you provide a warranty) and that users may redistribute the program under these conditions, and telling the user how to view a copy of this License. (Exception: if the Program itself is interactive but does not normally print such an announcement, your work based on the Program is not required to print an announcement.)

These requirements apply to the modified work as a whole. If identifiable sections of that work are not derived from the Program, and can be reasonably considered independent and separate works in themselves, then this License, and its terms, do not apply to those sections when you distribute them as separate works. But when you distribute the same sections as part of a whole which is a work based on the Program, the distribution of the whole must be on the terms of this License, whose permissions for other licensees extend to the entire whole, and thus to each and every part regardless of who wrote it.

Thus, it is not the intent of this section to claim rights or contest your rights to work written entirely by you; rather, the intent is to exercise the right to control the distribution of derivative or collective works based on the Program.

In addition, mere aggregation of another work not based on the Program with the Program (or with a work based on the Program) on a volume of a storage or distribution medium does not bring the other work under the scope of this License.

3. You may copy and distribute the Program (or a work based on it, under Section 2) in object code or executable form under the terms of Sections 1 and 2 above provided that you also do one of the following:
   a. Accompany it with the complete corresponding machine-readable source code, which must be distributed under the terms of Sections 1 and 2 above on a medium customarily used for software interchange; or,
   b. Accompany it with a written offer, valid for at least three years, to give any third party, for a charge no more than your cost of physically performing source distribution, a complete machine-readable copy of the corresponding source code, to be distributed under the terms of Sections 1 and 2 above on a medium customarily used for software interchange; or,
   c. Accompany it with the information you received as to the offer to distribute corresponding source code. (This alternative is allowed only for noncommercial distribution and only if you received the program in object code or executable form with such an offer, in accord with Subsection b above.)

The source code for a work means the preferred form of the work for making modifications to it. For an executable work, complete source code means all the source code for all modules it contains, plus any associated interface definition files, plus the scripts used to control
compilation and installation of the executable. However, as a special exception, the source code distributed need not include anything that is normally distributed (in either source or binary form) with the major components (compiler, kernel, and so on) of the operating system on which the executable runs, unless that component itself accompanies the executable.

If distribution of executable or object code is made by offering access to copy from a designated place, then offering equivalent access to copy the source code from the same place counts as distribution of the source code, even though third parties are not compelled to copy the source along with the object code.

4. You may not copy, modify, sublicense, or distribute the Program except as expressly provided under this License. Any attempt otherwise to copy, modify, sublicense or distribute the Program is void, and will automatically terminate your rights under this License. However, parties who have received copies, or rights, from you under this License will not have their licenses terminated so long as such parties remain in full compliance.

5. You are not required to accept this License, since you have not signed it. However, nothing else grants you permission to modify or distribute the Program or its derivative works. These actions are prohibited by law if you do not accept this License. Therefore, by modifying or distributing the Program (or any work based on the Program), you indicate your acceptance of this License to do so, and all its terms and conditions for copying, distributing or modifying the Program or works based on it.

6. Each time you redistribute the Program (or any work based on the Program), the recipient automatically receives a license from the original licensor to copy, distribute or modify the Program subject to these terms and conditions. You may not impose any further restrictions on the recipients' exercise of the rights granted herein. You are not responsible for enforcing compliance by third parties to this License.

7. If, as a consequence of a court judgment or allegation of patent infringement or for any other reason (not limited to patent issues), conditions are imposed on you (whether by court order, agreement or otherwise) that contradict the conditions of this License, they do not excuse you from the conditions of this License. If you cannot distribute so as to satisfy simultaneously your obligations under this License and any other pertinent obligations, then as a consequence you may not distribute the Program at all. For example, if a patent license would not permit royalty-free redistribution of the Program by all those who receive copies directly or indirectly through you, then the only way you could satisfy both it and this License would be to refrain entirely from distribution of the Program.

If any portion of this section is held invalid or unenforceable under any particular circumstance, the balance of the section is intended to apply and the section as a whole is intended to apply in other circumstances.

It is not the purpose of this section to induce you to infringe any patents or other property right claims or to contest validity of any such claims; this section has the sole purpose of protecting the integrity of the free software distribution system, which is implemented by public license practices. Many people have made generous contributions to the wide range of software distributed through that system in reliance on consistent application of that system; it is up to the author/donor to decide if he or she is willing to distribute software through any other system and a licensee cannot impose that choice.

This section is intended to make thoroughly clear what is believed to be a consequence of the rest of this License.

8. If the distribution and/or use of the Program is restricted in certain countries either by patents or by copyrighted interfaces, the original copyright holder who places the Program under this License may add an explicit geographical distribution limitation excluding those countries, so that distribution is permitted only in or among countries not thus excluded. In such case, this License incorporates the limitation as if written in the body of this License.

9. The Free Software Foundation may publish revised and/or new versions of the General Public License from time to time. Such new versions will be similar in spirit to the present version, but may differ in detail to address new problems or concerns.

Each version is given a distinguishing version number. If the Program specifies a version number of this License which applies to it and "any later version", you have the option of following the terms and conditions either of that version or of any later version published by the Free Software Foundation. If the Program does not specify a version number of this License, you may choose any version ever published by the Free Software Foundation.

10. If you wish to incorporate parts of the Program into other free programs whose distribution conditions are different, write to the author to ask for permission. For software which is copyrighted by the Free Software Foundation, write to the Free Software Foundation; we sometimes make exceptions for this. Our decision will be guided by the two goals of preserving the free status of all derivatives of our free software and of promoting the sharing and reuse of software generally.

NO WARRANTY

11. BECAUSE THE PROGRAM IS LICENSED FREE OF CHARGE, THERE IS NO WARRANTY FOR THE PROGRAM, TO THE EXTENT PERMITTED BY APPLICABLE LAW. EXCEPT WHEN OTHERWISE STATED IN WRITING THE COPYRIGHT HOLDERS AND/OR OTHER PARTIES PROVIDE THE PROGRAM "AS IS" WITHOUT WARRANTY OF ANY KIND, EITHER EXPRESSED OR IMPLIED, INCLUDING, BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE. THE ENTIRE RISK AS TO THE QUALITY AND PERFORMANCE OF THE PROGRAM IS WITH YOU. SHOULD THE PROGRAM PROVE DEFECTIVE, YOU ASSUME THE COST OF ALL NECESSARY SERVICING, REPAIR OR CORRECTION.

12. IN NO EVENT UNLESS REQUIRED BY APPLICABLE LAW OR AGREED TO IN WRITING WILL ANY COPYRIGHT HOLDER, OR ANY OTHER PARTY WHO MAY MODIFY AND/OR REDISTRIBUTE THE PROGRAM AS PERMITTED ABOVE, BE LIABLE TO YOU FOR DAMAGES, INCLUDING ANY GENERAL, SPECIAL, INCIDENTAL OR CONSEQUENTIAL DAMAGES ARISING OUT OF THE USE OR INABILITY TO USE THE PROGRAM (INCLUDING BUT NOT LIMITED TO LOSS OF DATA OR DATA BEING RENDERED
IN ACCURATE OR LOSSES SUSTAINED BY YOU OR THIRD PARTIES OR A FAILURE OF THE PROGRAM TO OPERATE WITH ANY OTHER PROGRAMS), EVEN IF SUCH HOLDER OR OTHER PARTY HAS BEEN ADVISED OF THE POSSIBILITY OF SUCH DAMAGES.

END OF TERMS AND CONDITIONS

How to Apply These Terms to Your New Programs

If you develop a new program, and you want it to be of the greatest possible use to the public, the best way to achieve this is to make it free software which everyone can redistribute and change under these terms.

To do so, attach the following notices to the program. It is safest to attach them to the start of each source file to most effectively convey the exclusion of warranty; and each file should have at least the "copyright" line and a pointer to where the full notice is found.

One line to give the program's name and a brief idea of what it does.

Copyright (C) <year> <name of author>

This program is free software; you can redistribute it and/or modify it under the terms of the GNU General Public License as published by the Free Software Foundation; either version 2 of the License, or (at your option) any later version.

This program is distributed in the hope that it will be useful, but WITHOUT ANY WARRANTY; without even the implied warranty of MERCHANTABILITY or FITNESS FOR A PARTICULAR PURPOSE. See the GNU General Public License for more details.

You should have received a copy of the GNU General Public License along with this program; if not, write to the Free Software Foundation, Inc., 59 Temple Place, Suite 330, Boston, MA 02111-1307 USA

Also add information on how to contact you by electronic and paper mail.

If the program is interactive, make it output a short notice like this when it starts in an interactive mode:

Gnomovision version 69, Copyright (C) year name of author Gnomovision comes with ABSOLUTELY NO WARRANTY; for details type 'show w'.This is free software, and you are welcome to redistribute it under certain conditions; type 'show c' for details.

The hypothetical commands 'show w' and 'show c' should show the appropriate parts of the General Public License.Of course, the commands you use may be called something other than 'show w' and 'show c'; they could even be mouse-clicks or menu items--whatever suits your program.

You should also get your employer (if you work as a programmer) or your school, if any, to sign a "copyright disclaimer" for the program, if necessary. Here is a sample; alter the names:

Yoyodyne, Inc., hereby disclaims all copyright interest in the program 'Gnomovision' (which makes passes at compilers) written by James Hacker.

signature of Ty Coon, 1 April 1989
Ty Coon, President of Vice

This General Public License does not permit incorporating your program into proprietary programs. If your program is a subroutine library, you may consider it more useful to permit linking proprietary applications with the library. If this is what you want to do, use the GNU Library General Public License instead of this License.

"CLASSPATH" EXCEPTION TO THE GPL

Certain source files distributed by Oracle America and/or its affiliates are subject to the following clarification and special exception to the GPL, but only where Oracle has expressly included in the particular source file's header the words "Oracle designates this particular file as subject to the "Classpath" exception as provided by Oracle in the LICENSE file that accompanied this code."

Linking this library statically or dynamically with other modules is making a combined work based on this library. Thus, the terms and conditions of the GNU General Public License cover the whole combination.

As a special exception, the copyright holders of this library give you permission to link this library with independent modules to produce an executable, regardless of the license terms of these independent modules, and to copy and distribute the resulting executable under terms of your choice, provided that you also meet, for each linked independent module, the terms and conditions of the license of that module.An independent module is a module which is not derived from or based on this library. If you modify this library, you may extend this exception to your version of the library, but you are not obligated to do so. If you do not wish to do so, delete this exception statement from your version.

COMMON DEVELOPMENT AND DISTRIBUTION LICENSE (CDDL)

Version 1.0

1. Definitions.
   1.1. Contributor means each individual or entity that creates or contributes to the creation of Modifications.
   1.2. Contributor Version means the combination of the Original Software, prior Modifications used by a Contributor (if any), and the Modifications made by that particular Contributor.
   1.3. Covered Software means (a) the Original Software, or (b) Modifications, or (c) the combination of files containing Original Software with files containing Modifications, in each case including portions thereof.
   1.4. Executable means the Covered Software in any form other than Source Code.
   1.5. Initial Developer means the individual or entity that first makes Original Software available under this License.
   1.6. Larger Work means a work which combines Covered Software or portions thereof with code not governed by the terms of this License.
   1.7. License means this document.
   1.8. Licensable means having the right to grant, to the maximum extent possible, whether at the time of the initial grant or subsequently acquired, any and all of the rights conveyed herein.
   1.9. Modifications means the Source Code and Executable form of any of the following:
      A. Any file that results from an addition to, deletion from or modification of the contents of a file containing Original Software or previous Modifications;
      B. Any new file that contains any part of the Original Software or previous Modification; or
      C. Any new file that is contributed or otherwise made available under the terms of this License.
   1.10. Original Software means the Source Code and Executable form of computer software code that is originally released under this License.
   1.11. Patent Claims means any patent claim(s), now owned or hereafter acquired, including without limitation, method, process, and apparatus claims, in any patent Licensable by grantor.
   1.12. Source Code means (a) the common form of computer software code in which

2. License Grants.
   2.1. The Initial Developer Grant.

Conditioned upon Your compliance with Section 3.1 below and subject to third party intellectual property claims, the Initial Developer hereby grants You a world-wide, royalty-free, non-exclusive license:

   (a) under intellectual property rights (other than patent or trademark) Licensable by Initial Developer, to use, reproduce, modify, display, perform, sublicense and distribute the Original Software (or portions thereof), with or without Modifications, and/or as part of a Larger Work; and

   (b) under Patent Claims infringed by the making, using or selling of Original Software, to make, have made, use, practice, sell, and offer for sale, and/or otherwise dispose of the Original Software (or portions thereof).
(c) The licenses granted in Sections 2.1(a) and (b) are effective on the date Initial Developer first distributes or otherwise makes the Original Software available to a third party under the terms of this License.

(d) Notwithstanding Section 2.1(b) above, no patent license is granted: (1) for code that You delete from the Original Software, or (2) for infringements caused by: (i) the modification of the Original Software, or (ii) the combination of the Original Software with other software or devices.

2.2. Contributor Grant.

Conditioned upon Your compliance with Section 3.1 below and subject to third party intellectual property claims, each Contributor hereby grants You a world-wide, royalty-free, non-exclusive license:

(a) under intellectual property rights (other than patent or trademark) Licensable by Contributor to use, reproduce, modify, display, perform, sublicense and distribute the Modifications created by such Contributor (or portions thereof), either on an unmodified basis, with other Modifications, as Covered Software and/or as part of a Larger Work; and

(b) under Patent Claims infringed by the making, using, or selling of Modifications made by that Contributor either alone and/or in combination with its Contributor Version (or portions of such combination), to make, use, sell, offer for sale, have made, and/or otherwise dispose of: (1) Modifications made by that Contributor (or portions thereof); and (2) the combination of Modifications made by that Contributor with its Contributor Version (or portions of such combination).

(c) The licenses granted in Sections 2.2(a) and 2.2(b) are effective on the date Contributor first distributes or otherwise makes the Modifications available to a third party.

(d) Notwithstanding Section 2.2(b) above, no patent license is granted: (1) for any code that Contributor has deleted from the Contributor Version; (2) for infringements caused by: (i) third party modifications of Contributor Version, or (ii) the combination of Modifications made by that Contributor with other software (except as part of the Contributor Version) or other devices; or (3) under Patent Claims infringed by Covered Software in the absence of Modifications made by that Contributor.

3. Distribution Obligations.

3.1. Availability of Source Code.

Any Covered Software that You distribute or otherwise make available in Executable form must also be made available in Source Code form and that Source Code form must be distributed only under the terms of this License.

You must include a copy of this License with every copy of the Source Code form of the Covered Software You distribute or otherwise make available. You must inform recipients of any such Covered Software in Executable form as to how they can obtain such Covered Software in Source Code form in a reasonable manner on or through a medium customarily used for software exchange.

3.2. Modifications.

The Modifications that You create or to which You contribute are governed by the terms of this License. You represent that You believe Your Modifications are Your original creation(s) and/or You have sufficient rights to grant the rights conveyed by this License.

3.3. Required Notices.

You must include a notice in each of Your Modifications that identifies You as the Contributor of the Modification. You may not remove or alter any copyright, patent or trademark notices contained within the Covered Software, or any notices of licensing or any descriptive text giving attribution to any Contributor or the Initial Developer.

3.4. Application of Additional Terms.

You may not offer or impose any terms on any Covered Software in Source Code form that alters or restricts the applicable version of this License or the recipients rights hereunder. You may choose to offer, and to charge a fee for, warranty, support, indemnity or liability obligations to one or more recipients of Covered Software. However, you may do so only on Your own behalf, and not on behalf of the Initial Developer or any Contributor. You must make it absolutely clear that any such warranty, support, indemnity or liability obligation is offered by You alone, and You hereby agree to indemnify the Initial Developer and every Contributor for any liability incurred by the Initial Developer or such Contributor as a result of warranty, support, indemnity or liability terms You offer.

3.5. Distribution of Executable Versions.

You may distribute the Executable form of the Covered Software under the terms of this License or under the terms of a license of Your choice, which may contain terms different from this License, provided that You are in compliance with the terms of this License and that the license for the Executable form does not attempt to limit or alter the recipients rights in the Source Code form from the rights set forth in this License. If You distribute the Covered Software in Executable form under a different license, You must make it absolutely clear that any terms which differ from this License are offered by You alone, not by the Initial Developer or Contributor. You hereby agree to indemnify the Initial Developer and every Contributor for any liability incurred by the Initial Developer or such Contributor as a result of any such terms You offer.

You may create a Larger Work by combining Covered Software with other code not governed by the terms of this License and distribute the Larger Work as a single product. In such a case, You must make sure the requirements of this License are fulfilled for the Covered Software.

4. Versions of the License.

4.1. New Versions.
4.2. Effect of New Versions.

You may always continue to use, distribute or otherwise make the Covered Software available under the terms of the version of the License under which You originally received the Covered Software. If the Initial Developer includes a notice in the Original Software prohibiting it from being distributed or otherwise made available under any subsequent version of the License, You must distribute and make the Covered Software available under the terms of the License under which You originally received the Covered Software. Otherwise, You may also choose to use, distribute or otherwise make the Covered Software available under the terms of any subsequent version of the License published by the license steward.

4.3. Modified Versions.

When You are an Initial Developer and You want to create a new license for Your Original Software, You may create and use a modified version of this License if You: (a) rename the license and remove any references to the name of the license steward (except to note that the license differs from this License); and (b) otherwise make it clear that the license contains terms which differ from this License.

5. DISCLAIMER OF WARRANTY.

COVERED SOFTWARE IS PROVIDED UNDER THIS LICENSE ON AN AS IS BASIS, WITHOUT WARRANTY OF ANY KIND, EITHER EXPRESSED OR IMPLIED, INCLUDING, WITHOUT LIMITATION, WARRANTIES THAT THE COVERED SOFTWARE IS FREE OF DEFECTS, MERCHANTABLE, FIT FOR A PARTICULAR PURPOSE OR NON-INFRINGEMENT. THE ENTIRE RISK AS TO THE QUALITY AND PERFORMANCE OF THE COVERED SOFTWARE IS WITH YOU. SHOULD ANY COVERED SOFTWARE PROVE DEFECTIVE IN ANY RESPECT, YOU (NOT THE INITIAL DEVELOPER OR ANY OTHER CONTRIBUTOR) ASSUME THE COST OF ALL NECESSARY SERVICING, REPAIR OR CORRECTION. THIS DISCLAIMER OF WARRANTY CONSTITUTES AN ESSENTIAL PART OF THIS LICENSE. NO USE OF ANY COVERED SOFTWARE IS AUTHORIZED HEREUNDER EXCEPT UNDER THIS DISCLAIMER.

6. TERMINATION.

6.1. This License and the rights granted hereunder will terminate automatically if You fail to comply with terms herein and fail to cure such breach within 30 days of becoming aware of the breach. Provisions which, by their nature, must remain in effect beyond the termination of this License shall survive.

6.2. If You assert a patent infringement claim (excluding declaratory judgment actions) against Initial Developer or a Contributor (the Initial Developer or Contributor against whom You assert such claim is referred to as Participant) alleging that the Participant Software (meaning the Contributor Version where the Participant is a Contributor or the Original Software where the Participant is the Initial Developer) directly or indirectly infringes any patent, then any and all rights granted directly or indirectly to You by such Participant, the Initial Developer (if the Initial Developer is not the Participant) and all Contributors under Sections 2.1 and/or 2.2 of this License shall, upon 60 days notice from Participant terminate prospectively and automatically at the expiration of such 60 day notice period, unless if within such 60 day period You withdraw Your claim with respect to the Participant Software against such Participant either unilaterally or pursuant to a written agreement with Participant.

6.3. In the event of termination under Sections 6.1 or 6.2 above, all end user licenses that have been validly granted by You or any distributor hereunder prior to termination (excluding licenses granted to You by any distributor) shall survive termination.

7. LIMITATION OF LIABILITY.

UNDER NO CIRCUMSTANCES AND UNDER NO LEGAL THEORY, WHETHER TORT (INCLUDING NEGLIGENCE), CONTRACT, OR OTHERWISE, SHALL YOU, THE INITIAL DEVELOPER, ANY OTHER CONTRIBUTOR, OR ANY DISTRIBUTOR OF COVERED SOFTWARE, OR ANY SUPPLIER OF ANY OF SUCH PARTIES, BE LIABLE TO ANY PERSON FOR ANY INDIRECT, SPECIAL, INCIDENTAL, OR CONSEQUENTIAL DAMAGES OF ANY NATURE INCLUDING, WITHOUT LIMITATION, DAMAGES FOR LOST PROFITS, LOSS OF GOODWILL, WORK STOPPAGE, COMPUTER FAILURE OR MALFUNCTION, OR ANY AND ALL OTHER COMMERCIAL DAMAGES OR LOSSES, EVEN IF SUCH PARTY SHALL HAVE BEEN INFORMED OF THE POSSIBILITY OF SUCH DAMAGES. THIS LIMITATION OF LIABILITY SHALL APPLY TO ALL LIABILITY OF THE LICENSEE UNDER THIS LICENSE, INCLUDING LIABILITY ARISING FROM THE PERFORMANCE OR NONPERFORMANCE OF THE LICENSED SOFTWARE.

8. U.S. GOVERNMENT END USERS.

The Covered Software is a commercial item, as that term is defined in 48 C.F.R. 2.101 (Oct. 1995), consisting of commercial computer software (as that term is defined at 48 C.F.R. 252.227-7014(a)(1)) and commercial computer software documentation as such terms are used in 48 C.F.R. 12.212 (Sept. 1995). Consistent with 48 C.F.R. 12.212 and 48 C.F.R. 227.7202-1 through 227.7202-4 (June 1995), all U.S. Government End Users acquire Covered Software with only those rights set forth herein. This U.S. Government Rights clause is in lieu of, and supersedes, any other FAR, DFAR, or other clause or provision that addresses Government rights in computer software under this License.

9. MISCELLANEOUS.

This License represents the complete agreement concerning subject matter hereof. If any provision of this License is held to be unenforceable, such provision shall be reformed only to the extent necessary to make it enforceable. This License shall be governed by the law of the jurisdiction specified in a notice contained within the Original Software (except to the extent applicable law, if any, provides otherwise), excluding such jurisdictions conflict-of-law provisions. Any litigation relating to this License shall be subject to the jurisdiction of the courts located in the jurisdiction and venue specified in a notice contained within the Original Software, with the losing party responsible for costs, including, without limitation, court costs and reasonable attorneys fees and expenses. The application of the United Nations Convention on Contracts for the
International Sale of Goods is expressly excluded. Any law or regulation which provides that the language of a contract shall be construed against the drafter shall not apply to this License. You agree that You alone are responsible for compliance with the United States export administration regulations (and the export control laws and regulation of any other countries) when You use, distribute or otherwise make available any Covered Software.

10. RESPONSIBILITY FOR CLAIMS.

As between Initial Developer and the Contributors, each party is responsible for claims and damages arising, directly or indirectly, out of its utilization of rights under this License and You agree to work with Initial Developer and Contributors to distribute such responsibility on an equitable basis. Nothing herein is intended or shall be deemed to constitute any admission of liability.

The FreeType Project LICENSE

2002-Apr-11

Copyright 1996-2002 by
David Turner, Robert Wilhelm, and Werner Lemberg

Introduction
============

The FreeType Project is distributed in several archive packages; some of them may contain, in addition to the FreeType font engine, various tools and contributions which rely on, or relate to, the FreeType Project.

This license applies to all files found in such packages, and which do not fall under their own explicit license. The license affects thus the FreeType font engine, the test programs, documentation and makefiles, at the very least.

This license was inspired by the BSD, Artistic, and IJG (Independent JPEG Group) licenses, which all encourage inclusion and use of free software in commercial and freeware products alike. As a consequence, its main points are that:

- We don't promise that this software works. However, we will be interested in any kind of bug reports. (‘as is’ distribution)
- You can use this software for whatever you want, in parts or full form, without having to pay us. (‘royalty-free’ usage)
- You may not pretend that you wrote this software. If you use it, or only parts of it, in a program, you must acknowledge somewhere in your documentation that you have used the FreeType code. (‘credits’)

We specifically permit and encourage the inclusion of this software, with or without modifications, in commercial products. We disclaim all warranties covering The FreeType Project and assume no liability related to The FreeType Project.

Finally, many people asked us for a preferred form for a credit/disclaimer to use in compliance with this license. We thus encourage you to use the following text:

```
* * *
Portions of this software are copyright © 1996-2002 The FreeType Project (www.freetype.org). All rights reserved.
```

Legal Terms
===========

0. Definitions
--------------

Throughout this license, the terms ‘package’, ‘FreeType Project’, and ‘FreeType archive’ refer to the set of files originally distributed by the authors (David Turner, Robert Wilhelm, and Werner Lemberg) as the ‘FreeType Project’, be they named as alpha, beta or final release.

‘You’ refers to the licensee, or person using the project, where ‘using’ is a generic term including compiling the project’s source code as well as linking it to form a ‘program’ or ‘executable’. This program is referred to as ‘a program using the FreeType engine’.

This license applies to all files distributed in the original FreeType Project, including all source code, binaries and documentation, unless otherwise stated in the file in its original, unmodified form as distributed in the original archive. If you are unsure whether or not a particular file is covered by this license, you must contact us to verify this.

The FreeType Project is copyright (C) 1996-2000 by David Turner, Robert Wilhelm, and Werner Lemberg. All rights reserved except as specified below.

1. No Warranty
--------------

THE FREE TYPE PROJECT IS PROVIDED ‘AS IS’ WITHOUT WARRANTY OF ANY KIND, EITHER EXPRESS OR IMPLIED, INCLUDING, BUT NOT LIMITED TO, WARRANTIES OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE. IN NO EVENT WILL ANY OF THE AUTHORS OR COPYRIGHT HOLDERS BE LIABLE FOR ANY DAMAGES CAUSED BY THE USE OR THE INABILITY TO USE, OF THE FREE TYPE PROJECT.

2. Redistribution
--------------
This license grants a worldwide, royalty-free, perpetual and irrevocable right and license to use, execute, perform, compile, display, copy, create derivative works of, distribute and sublicense the FreeType Project (in both source and object code forms) and derivative works thereof for any purpose; and to authorize others to exercise some or all of the rights granted herein, subject to the following conditions:

- Redistribution of source code must retain this license file (`FTL.TXT') unaltered; any additions, deletions or changes to the original files must be clearly indicated in accompanying documentation. The copyright notices of the unaltered, original files must be preserved in all copies of source files.
- Redistribution in binary form must provide a disclaimer that states that the software is based in part of the work of the FreeType Team, in the distribution documentation. We also encourage you to put an URL to the FreeType web page in your documentation, though this isn't mandatory.

These conditions apply to any software derived from or based on the FreeType Project, not just the unmodified files. If you use our work, you must acknowledge us. However, no fee need be paid to us.

3. Advertising

Neither the FreeType authors and contributors nor you shall use the name of the other for commercial, advertising, or promotional purposes without specific prior written permission.

We suggest, but do not require, that you use one or more of the following phrases to refer to this software in your documentation or advertising materials: `FreeType Project', `FreeType Engine', `FreeType library', or `FreeType Distribution'.

As you have not signed this license, you are not required to accept it. However, as the FreeType Project is copyrighted material, only this license, or another one contracted with the authors, grants you the right to use, distribute, and modify it. Therefore, by using, distributing, or modifying the FreeType Project, you indicate that you understand and accept all the terms of this license.

4. Contacts

There are two mailing lists related to FreeType:

- freetype@freetype.org
  Discusses general use and applications of FreeType, as well as future and wanted additions to the library and distribution. If you are looking for support, start in this list if you haven't found anything to help you in the documentation.

- devel@freetype.org
  Discusses bugs, as well as engine internals, design issues, specific licenses, porting, etc.

- http://www.freetype.org
  Holds the current FreeType web page, which will allow you to download our latest development version and read online documentation.

You can also contact us individually at:

David Turner <david.turner@freetype.org>
Robert Wilhelm <robert.wilhelm@freetype.org>
Werner Lemberg <werner.lemberg@freetype.org>

The Independent JPEG Group’s JPEG software

In plain English:

1. We don't promise that this software works. (But if you find any bugs, please let us know!)
2. You can use this software for whatever you want. You don't have to pay us.
3. You may not pretend that you wrote this software. If you use it in a program, you must acknowledge somewhere in your documentation that you've used the IJG code.

In legalese:

The authors make NO WARRANTY or representation, either express or implied, with respect to this software, its quality, accuracy, merchantability, or fitness for a particular purpose. This software is provided "AS IS", and you, its user, assume the entire risk as to its quality and accuracy.

This software is copyright (C) 1991-1998, Thomas G. Lane. All Rights Reserved except as specified below.
Permission is hereby granted to use, copy, modify, and distribute this software (or portions thereof) for any purpose, without fee, subject to these conditions:

(1) If any part of the source code for this software is distributed, then this README file must be included, with this copyright and no-warranty notice unaltered; and any additions, deletions, or changes to the original files must be clearly indicated in accompanying documentation.

(2) If only executable code is distributed, then the accompanying documentation must state that "this software is based in part on the work of the Independent JPEG Group".

(3) Permission for use of this software is granted only if the user accepts full responsibility for any undesirable consequences; the authors accept NO LIABILITY for damages of any kind.

These conditions apply to any software derived from or based on the IJG code, not just to the unmodified library. If you use our work, you ought to acknowledge us.

Permission is NOT granted for the use of this software as the basis of commercial products, provided that all warranty or liability claims are assumed by the product vendor.

ansi2knr.c is included in this distribution by permission of L. Peter Deutsch, sole proprietor of its copyright holder, Aladdin Enterprises of Menlo Park, CA. ansi2knr.c is NOT covered by the above copyright and conditions, but instead by the usual distribution terms of the Free Software Foundation; principally, that you must include source code if you redistribute it. (See the file ansi2knr.c for full details.) However, since ansi2knr.c is not needed as part of any program generated from the IJG code, this does not limit you more than the foregoing paragraphs do.

The Unix configuration script "configure" was produced with GNU Autoconf. It is copyright by the Free Software Foundation but is freely distributable. The same holds for its supporting scripts (config.guess, config.sub, lconfig, ltmain.sh). Another support script, install-sh, is copyright by M.I.T. but is also freely distributable.

It appears that the arithmetic coding option of the JPEG spec is covered by patents owned by IBM, AT&T, and Mitsubishi. Hence arithmetic coding cannot legally be used without obtaining one or more licenses. For this reason, support for arithmetic coding has been removed from the free JPEG software. (Since arithmetic coding provides only a marginal gain over the unpatented Huffman mode, it is unlikely that very many implementations will support it.) So far as we are aware, there are no patent restrictions on the remaining code.

The IJG distribution formerly included code to read and write GIF files. To avoid entanglement with the Unisys LZW patent, GIF reading support has been removed altogether, and the GIF writer has been simplified to produce "uncompressed GIFs". This technique does not use the LZW algorithm; the resulting GIF files are larger than usual, but are readable by all standard GIF decoders.

We are required to state that

"The Graphics Interchange Format(c) is the Copyright property of CompuServe Incorporated.GIF(sm) is a Service Mark property of CompuServe Incorporated."

Net-SNMP

Various copyrights apply to this package, listed in various separate parts below. Please make sure that you read all the parts. Up until 2001, the project was based at UC Davis, and the first part covers all code written during this time. From 2001 onwards, the project has been based at SourceForge, and Networks Associates Technology, Inc hold the copyright on behalf of the wider Net-SNMP community, covering all derivative work done since then. An additional copyright section has been added as Part 3 below also under a BSD license for the work contributed by Cambridge Broadband Ltd. to the project since 2001. An additional copyright section has been added as Part 4 below also under a BSD license for the work contributed by Sun Microsystems, Inc. to the project since 2003.

Code has been contributed to this project by many people over the years it has been in development, and a full list of contributors can be found in the README file under the THANKS section.

The PHP License, version 3.01

Copyright (c) 1999 - 2006 The PHP Group. All rights reserved. Redistribution and use in source and binary forms, with or without modification, is permitted provided that the following conditions are met:

1. Redistributions of source code must retain the above copyright notice, this list of conditions and the following disclaimer.

2. Redistributions in binary form must reproduce the above copyright notice, this list of conditions and the following disclaimer in the documentation and/or other materials provided with the distribution.

3. The name "PHP" must not be used to endorse or promote products derived from this software without prior written permission. For written permission, please contact group@php.net.

4. Products derived from this software may not be called "PHP", nor may "PHP" appear in their name, without prior written permission from group@php.net. You may indicate that your software works in conjunction with PHP by saying "Foo for PHP" instead of calling it "PHP Foo" or "phpfoo".

5. The PHP Group may publish revised and/or new versions of the license from time to time. Each version will be given a distinguishing version number. Once covered code has been published under a particular version of the license, you may always continue to use it under the terms of that version. You may also choose to use such covered code under the terms of any subsequent version of the license published by the PHP Group. No other than the PHP Group has the right to modify the terms applicable to covered code created under this License.

6. Redistributions of any form whatsoever must retain the following acknowledgment:

   "This product includes PHP software, freely available from <http://www.php.net/software/>".

THIS SOFTWARE IS PROVIDED BY THE PHP DEVELOPMENT TEAM "AS IS" AND ANY EXPRESSED OR IMPLIED WARRANTIES, INCLUDING, BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE ARE DISCLAIMED. IN NO EVENT SHALL THE PHP DEVELOPMENT TEAM OR ITS CONTRIBUTORS BE LIABLE FOR ANY DIRECT, INDIRECT, INCIDENTAL, SPECIAL, EXEMPLARY, OR CONSEQUENTIAL DAMAGES (INCLUDING, BUT NOT LIMITED TO, PROCUREMENT OF SUBSTITUTE GOODS OR SERVICES; LOSS OF USE, DATA, OR PROFITS; OR BUSINESS INTERRUPTION) HOWEVER CAUSED AND ON ANY THEORY OF LIABILITY, WHETHER IN CONTRACT, STRICT LIABILITY, OR TORT (INCLUDING NEGLIGENCE OR OTHERWISE) ARISING IN ANY WAY OUT OF THE USE OF THIS SOFTWARE, EVEN IF ADVISED OF THE POSSIBILITY OF SUCH DAMAGE.

This software consists of voluntary contributions made by many individuals on behalf of the PHP Group.

The PHP Group can be contacted via Email at group@php.net.

For more information on the PHP Group and the PHP project,

please see <http://www.php.net>.

INFO-ZIP

Copyright (c) 1990-2007 Info-ZIP. All rights reserved.

For the purposes of this copyright and license, "Info-ZIP" is defined as the following set of individuals:

This software is provided "as is," without warranty of any kind, express or implied. In no event shall Info-ZIP or its contributors be held liable for any direct, indirect, incidental, special or consequential damages arising out of the use of or inability to use this software.

Permission is granted to anyone to use this software for any purpose, including commercial applications, and to alter it and redistribute it freely, subject to the above disclaimer and the following restrictions:

1. Redistributions of source code (in whole or in part) must retain the above copyright notice, definition, disclaimer, and this list of conditions.

2. Redistributions in binary form (compiled executables and libraries) must reproduce the above copyright notice, definition, disclaimer, and this list of conditions in documentation and/or other materials provided with the distribution. The sole exception to this condition is redistribution of a standard UnZipSFX binary (including SFXWiz) as part of a self-extracting archive; that is permitted without inclusion of this license, as long as the normal SFX banner has not been removed from the binary or disabled.

3. Altered versions—including, but not limited to, ports to new operating systems, existing ports with new graphical interfaces, versions with modified or added functionality, and dynamic, shared, or static library versions not from Info-ZIP—must be plainly marked as such and must not be misrepresented as being the original source or, if binaries, compiled from the original source. Such altered versions also must not be misrepresented as being Info-ZIP releases-including, but not limited to, labeling of the altered versions with the names "Info-ZIP" (or any variation thereof, including, but not limited to, different capitalizations), "Pocket UnZip," "WiZ" or "MacZip" without the explicit permission of Info-ZIP. Such altered versions are further prohibited from misrepresentative use of the Zip-Bugs or Info-ZIP e-mail addresses or the Info-ZIP URL(s), such as to imply Info-ZIP will provide support for the altered versions.

Importlib

(No license included in the package, this is in the readme)

Purpose
=======

This package contains the code from importlib as found in Python 2.7. It is provided so that people who wish to use "importlib.import_module()" with a version of Python prior to 2.7 or in 3.0 have the function readily available. The code in no way deviates from what can be found in the Python 2.7 standard library.

For documentation, see the `importlib docs`_ for Python 2.7.

PSF License Agreement for Python 2.6

1. This LICENSE AGREEMENT is between the Python Software Foundation ("PSF"), and the Individual or Organization ("Licensee") accessing and otherwise using this software ("Python") in source or binary form and its associated documentation.
2. Subject to the terms and conditions of this License Agreement, PSF hereby grants Licensee a nonexclusive, royalty-free, world-wide license to reproduce, analyze, test, perform and/or display publicly, prepare derivative works, distribute, and otherwise use Python alone or in any derivative version, provided, however, that PSF's License Agreement and PSF's notice of copyright, i.e., "Copyright (c) 2001, 2002, 2003, 2004, 2005, 2006 Python Software Foundation; All Rights Reserved" are retained in Python alone or in any derivative version prepared by Licensee.
3. In the event Licensee prepares a derivative work that is based on or incorporates Python or any part thereof, and wants to make the derivative work available to others as provided herein, then Licensee hereby agrees to include in any such work a brief summary of the changes made to Python.
4. PSF is making Python available to Licensee on an "AS IS" basis. PSF MAKES NO REPRESENTATIONS OR WARRANTIES, EXPRESS OR IMPLIED. BY WAY OF EXAMPLE, BUT NOT LIMITATION, PSF MAKES NO AND DISCLAIMS ANY REPRESENTATION OR WARRANTY OF MERCHANTABILITY OR FITNESS FOR ANY PARTICULAR PURPOSE OR THAT THE USE OF PYTHON WILL NOT INFRINGE ANY THIRD PARTY RIGHTS.
5. PSF SHALL NOT BE LIABLE TO LICENSEE OR ANY OTHER USERS OF PYTHON FOR ANY INCIDENTAL, SPECIAL, OR CONSEQUENTIAL DAMAGES OR LOSS AS A RESULT OF MODIFYING, DISTRIBUTING, OR OTHERWISE USING PYTHON, OR ANY DERIVATIVE THEREOF, EVEN IF ADVISED OF THE POSSIBILITY THEREOF.

Copyright ©2019, Infoblox, Inc. All right reserved.
6. This License Agreement will automatically terminate upon a material breach of its terms and conditions.
7. Nothing in this License Agreement shall be deemed to create any relationship of agency, partnership, or joint venture between PSF and Licensee. This License Agreement does not grant permission to use PSF trademarks or trade name in a trademark sense to endorse or promote products or services of Licensee, or any third party.
8. By copying, installing or otherwise using Python, Licensee agrees to be bound by the terms and conditions of this License Agreement.

PSF License Agreement for Python 3.5.0

1. This LICENSE AGREEMENT is between the Python Software Foundation ("PSF"), and the Individual or Organization ("Licensee") accessing and otherwise using Python 3.5.0 software in source or binary form and its associated documentation.
2. Subject to the terms and conditions of this License Agreement, PSF hereby grants Licensee a nonexclusive, royalty-free, world-wide license to reproduce, analyze, test, perform and/or display publicly, prepare derivative works, distribute, and otherwise use Python 3.5.0 alone or in any derivative version, provided, however, that PSF’s License Agreement and PSF’s notice of copyright, i.e., “Copyright © 2001-2015 Python Software Foundation; All Rights Reserved” are retained in Python 3.5.0 alone or in any derivative version prepared by Licensee.
3. In the event Licensee prepares a derivative work that is based on or incorporates Python 3.5.0 or any part thereof, and wants to make the derivative work available to others as provided herein, then Licensee hereby agrees to include in any such work a brief summary of the changes made to Python 3.5.0.
4. PSF is making Python 3.5.0 available to Licensee on an "AS IS" basis. PSF MAKES NO REPRESENTATIONS OR WARRANTIES, EXPRESS OR IMPLIED. BY WAY OF EXAMPLE, BUT NOT LIMITATION, PSF MAKES NO AND DISCLAIMS ANY REPRESENTATION OR WARRANTY OF MERCHANTABILITY OR FITNESS FOR ANY PARTICULAR PURPOSE OR THAT THE USE OF PYTHON 3.5.0 WILL NOT INFRINGE ANY THIRD PARTY RIGHTS.
5. PSF SHALL NOT BE LIABLE TO LICENSEE OR ANY OTHER USERS OF PYTHON 3.5.0 FOR ANY INCIDENTAL, SPECIAL, OR CONSEQUENTIAL DAMAGES OR LOSS AS A RESULT OF MODIFYING, DISTRIBUTING, OR OTHERWISE USING PYTHON 3.5.0, OR ANY DERIVATIVE THEREOF, EVEN IF ADVISED OF THE POSSIBILITY THEREOF.
6. This License Agreement will automatically terminate upon a material breach of its terms and conditions.
7. Nothing in this License Agreement shall be deemed to create any relationship of agency, partnership, or joint venture between PSF and Licensee. This License Agreement does not grant permission to use PSF trademarks or trade name in a trademark sense to endorse or promote products or services of Licensee, or any third party.
8. By copying, installing or otherwise using Python 3.5.0, Licensee agrees to be bound by the terms and conditions of this License Agreement.

GNU General Public License 2.0 for Suricata, Netfilter and IPTables

GNU General Public License
Version 2, June 1991 Copyright © 1989, 1991 Free Software Foundation, Inc. 51 Franklin Street, Fifth Floor, Boston, MA 02110-1301 USA

Everyone is permitted to copy and distribute verbatim copies of this license document, but changing it is not allowed.

Preamble

The licenses for most software are designed to take away your freedom to share and change it. By contrast, the GNU General Public License is intended to guarantee your freedom to share and change free software--to make sure the software is free for all its users. This General Public License applies to most of the Free Software Foundation's software and to any other program whose authors commit to using it. (Some other Free Software Foundation software is covered by the GNU Lesser General Public License instead.) You can apply it to your programs, too.

When we speak of free software, we are referring to freedom, not price. Our General Public Licenses are designed to make sure that you have the freedom to distribute copies of free software (and charge for this service if you wish), that you receive source code or can get it if you want it, that you can change the software or use pieces of it in new free programs; and that you know you can do these things.

To protect your rights, you need to make restrictions that forbid anyone to deny you these rights or to ask you to surrender the rights. These restrictions translate to certain responsibilities for you if you distribute copies of the software, or if you modify it.

For example, if you distribute copies of such a program, whether gratis or for a fee, you must give the recipients all the rights that you have. You must make sure that they, too, receive or can get the source code. And you must show them these terms so they know their rights.

We protect your rights with two steps: (1) copyright the software, and (2) offer you this license which gives you legal permission to copy, distribute and/or modify the software.

Also, for each author's protection and ours, we want to make certain that everyone understands that there is no warranty for this free software. If the software is modified by someone else and passed on, we want its recipients to know that what they have is not the original, so that any problems introduced by others will not reflect on the original authors' reputations.

Finally, any free program is threatened constantly by software patents. We wish to avoid the danger that redistributors of a free program will individually obtain patent licenses, in effect making the program proprietary. To prevent this, we have made it clear that any patent must be licensed for everyone's free use or not licensed at all.

The precise terms and conditions for copying, distribution and modification follow.

TERMS AND CONDITIONS FOR COPYING, DISTRIBUTION AND MODIFICATION

0. This License applies to any program or other work which contains a notice placed by the copyright holder saying it may be distributed under the terms of this General Public License. The "Program", below, refers to any such program or work, and a "work based on the Program" means either the Program or any derivative work under copyright law: that is to say, a work containing the Program or a portion of
it, either verbatim or with modifications and/or translated into another language. (Hereinafter, translation is included without limitation in the term "modification"). Each licensor is addressed as "you".

Activities other than copying, distribution and modification are not covered by this License; they are outside its scope. The act of running the Program is not restricted, and the output from the Program is covered only if its contents constitute a work based on the Program (independent of having been made by running the Program). Whether that is true depends on what the Program does.

1. You may copy and distribute verbatim copies of the Program’s source code as you receive it, in any medium, provided that you conspicuously and appropriately publish on each copy an appropriate copyright notice and disclaimer of warranty; keep intact all the notices that refer to this License and to the absence of any warranty; and give any other recipients of the Program a copy of this License along with the Program.

You may charge a fee for the physical act of transferring a copy, and you may at your option offer warranty protection in exchange for a fee.

2. You may modify your copy or copies of the Program or any portion of it, thus forming a work based on the Program, and copy and distribute such modifications or work under the terms of Section 1 above, provided that you also meet all of these conditions:
   a. You must cause the modified files to carry prominent notices stating that you changed the files and the date of any change.
   b. You must cause any work that you distribute or publish, that in whole or in part contains or is derived from the Program or any part thereof, to be licensed as a whole at no charge to all third parties under the terms of this License.
   c. If the modified program normally reads commands interactively when run, you must cause it, when started running for such interactive use in the most ordinary way, to print or display an announcement including an appropriate copyright notice and a notice that there is no warranty (or else, saying that you provide a warranty) and that users may redistribute the program under these conditions, and telling the user how to view a copy of this License. (Exception: if the Program itself is interactive but does not normally print such an announcement, your work based on the Program is not required to print an announcement.)

These requirements apply to the modified work as a whole. If identifiable sections of that work are not derived from the Program, and can be reasonably considered independent and separate works in themselves, then this License, and its terms, do not apply to those sections when you distribute them as separate works. But when you distribute the same sections as part of a whole which is a work based on the Program, the distribution of the whole must be on the terms of this License, whose permissions for other licensees extend to the entire whole, and thus to each and every part regardless of who wrote it.

Thus, it is not the intent of this section to claim rights or contest your rights to work written entirely by you; rather, the intent is to exercise the right to control the distribution of derivative or collective works based on the Program.

In addition, mere aggregation of another work not based on the Program with the Program (or with a work based on the Program) on a volume of a storage or distribution medium does not bring the other work under the scope of this License.

3. You may copy and distribute the Program (or a work based on it, under Section 2) in object code or executable form under the terms of Sections 1 and 2 above provided that you also do one of the following:
   a. Accompany it with the complete corresponding machine-readable source code, which must be distributed under the terms of Sections 1 and 2 above on a medium customarily used for software interchange;
   b. Accompany it with a written offer, valid for at least three years, to give any third party, for a charge no more than your cost of physically performing source distribution, a complete machine-readable copy of the corresponding source code, to be distributed under the terms of Sections 1 and 2 above on a medium customarily used for software interchange;
   c. Accompany it with the information you received as to the offer to distribute corresponding source code. (This alternative is allowed only for noncommercial distribution and only if you received the program in object code or executable form with such an offer, in accord with Subsection b above.)

The source code for a work means the preferred form of the work for making modifications to it. For an executable work, complete source code means all the source code for all modules it contains, plus any associated interface definition files, plus the scripts used to control compilation and installation of the executable. However, as a special exception, the source code distributed need not include anything that is normally distributed (in either source or binary form) with the major components (compiler, kernel, and so on) of the operating system on which the executable runs, unless that component itself accompanies the executable.

If distribution of executable or object code is made by offering access to copy from a designated place, then offering equivalent access to copy the source code from the same place counts as distribution of the source code, even though third parties are not compelled to copy the source along with the object code.

4. You may not copy, modify, sublicense, or distribute the Program except as expressly provided under this License. Any attempt otherwise to copy, modify, sublicense or distribute the Program is void, and will automatically terminate your rights under this License. However, parties who have received copies, or rights, from you under this License will not have their licenses terminated so long as such parties remain in full compliance.

5. You are not required to accept this License, since you have not signed it. However, nothing else grants you permission to modify or redistribute the Program or its derivative works. These actions are prohibited by law if you do not accept this License. Therefore, by modifying or distributing the Program (or any work based on the Program), you indicate your acceptance of this License to do so, and all its terms and conditions for copying, modifying or distributing the Program or works based on it.

6. Each person redistributing the Program (or any work based on the Program), the recipient automatically receives a license from the original licensor to copy, distribute or modify the Program subject to these terms and conditions. You may not impose any further restrictions on the recipients’ exercise of the rights granted herein. You are not responsible for enforcing compliance by third parties to this License.

7. If, as a consequence of a court judgment or allegation of patent infringement or for any other reason (not limited to patent issues), conditions are imposed on you (whether by court order, agreement or otherwise) that contradict the conditions of this License, they do not excuse you from the conditions of this License. If you cannot distribute so as to satisfy simultaneously your obligations under this License and any other pertinent obligations, then as a consequence you may not distribute the Program at all. For example, if a patent license would not permit royalty-free redistribution of the Program by all those who receive copies directly or indirectly through you, then the only way you could satisfy both it and this License would be to refrain entirely from distribution of the Program.

If any portion of this section is held invalid or unenforceable under any particular circumstance, the balance of the section is intended to apply and the section as a whole is intended to apply in other circumstances. It is not the purpose of this section to induce you to infringe any patents or other property right claims or to contest validity of any such claims; this section has the sole purpose of protecting the integrity of the free software distribution system, which is implemented by public license practices. Many people have made generous contributions to the wide range of software distributed through that system in
reliance on consistent application of that system; it is up to the author/donor to decide if he or she is willing to distribute software through any other system and a licensee cannot impose that choice.

This section is intended to make thoroughly clear what is believed to be a consequence of the rest of this License.

8. If the distribution and/or use of the Program is restricted in certain countries either by patents or by copyrighted interfaces, the original copyright holder who places the Program under this License may add an explicit geographical distribution limitation excluding those countries, so that distribution is permitted only in or among countries not thus excluded. In such case, this License incorporates the limitation as if written in the body of this License.

9. The Free Software Foundation may publish revised and/or new versions of the General Public License from time to time. Such new versions will be similar in spirit to the present version, but may differ in detail to address new problems or concerns. Each version is given a distinguishing version number. If the Program specifies a version number of this License which applies to it and "any later version", you have the option of following the terms and conditions either of that version or of any later version published by the Free Software Foundation. If the Program does not specify a version number of this License, you may choose any version ever published by the Free Software Foundation.

10. If you wish to incorporate parts of the Program into other free programs whose distribution conditions are different, write to the author to ask for permission. For software which is copyrighted by the Free Software Foundation, write to the Free Software Foundation; we sometimes make exceptions for this. Our decision will be guided by the two goals of preserving the free status of all derivatives of our free software and of promoting the sharing and reuse of software generally.

NO WARRANTY

11. BECAUSE THE PROGRAM IS LICENSED FREE OF CHARGE, THERE IS NO WARRANTY FOR THE PROGRAM, TO THE EXTENT PERMITTED BY APPLICABLE LAW. EXCEPT WHEN OTHERWISE STATED IN WRITING THE COPYRIGHT HOLDERS AND/OR OTHER PARTIES PROVIDE THE PROGRAM "AS IS" WITHOUT WARRANTY OF ANY KIND, EITHER EXPRESSED OR IMPLIED, INCLUDING, BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE. THE ENTIRE RISK AS TO THE QUALITY AND PERFORMANCE OF THE PROGRAM IS WITH YOU. SHOULD THE PROGRAM PROVE DEFECTIVE, YOU ASSUME THE COST OF ALL NECESSARY SERVICING, REPAIR OR CORRECTION.

12. IN NO EVENT UNLESS REQUIRED BY APPLICABLE LAW OR AGREED TO IN WRITING WILL ANY COPYRIGHT HOLDER, OR ANY OTHER PARTY WHO MAY MODIFY AND/OR REDISTRIBUTE THE PROGRAM AS PERMITTED ABOVE, BE LIABLE TO YOU FOR DAMAGES, INCLUDING ANY GENERAL, SPECIAL, INCIDENTAL OR CONSEQUENTIAL DAMAGES ARISING OUT OF THE USE OR INABILITY TO USE THE PROGRAM (INCLUDING BUT NOT LIMITED TO LOSS OF DATA OR DATA BEING RENDERED INACCURATE OR LOSSES SUSTAINED BY YOU OR THIRD PARTIES OR A FAILURE OF THE PROGRAM TO OPERATE WITH ANY OTHER PROGRAMS), EVEN IF SUCH HOLDER OR OTHER PARTY HAS BEEN ADVISED OF THE POSSIBILITY OF SUCH DAMAGES.

END OF TERMS AND CONDITIONS

How to Apply These Terms to Your New Programs

If you develop a new program, and you want it to be of the greatest possible use to the public, the best way to achieve this is to make it free software which everyone can redistribute and change under these terms.

To do so, attach the following notices to the program. It is safest to attach them to the start of each source file to most effectively convey the exclusion of warranty; and each file should have at least the "copyright" line and a pointer to where the full notice is found.

<one line to give the program's name and a brief idea of what it does.> Copyright (C) <year> <name of author>

This program is free software; you can redistribute it and/or modify it under the terms of the GNU General Public License as published by the Free Software Foundation; either version 2 of the License, or (at your option) any later version.

This program is distributed in the hope that it will be useful, but WITHOUT ANY WARRANTY; without even the implied warranty of MERCHANTABILITY or FITNESS FOR A PARTICULAR PURPOSE. See the GNU General Public License for more details.

You should have received a copy of the GNU General Public License along with this program; if not, write to the Free Software Foundation, Inc., 51 Franklin Street, Fifth Floor, Boston, MA 02110-1301 USA.

Also add information on how to contact you by electronic and paper mail.

If the program is interactive, make it output a short notice like this when it starts in an interactive mode:

Gnomovision version 69, Copyright (C) <year> name of author Gnomovision comes with ABSOLUTELY NO WARRANTY; for details type `show w'. This is free software, and you are welcome to redistribute it under certain conditions; type `show c' for details.

The hypothetical commands `show w' and `show c' should show the appropriate parts of the General Public License. Of course, the commands you use may be called something other than `show w' and `show c'; they could even be mouse-clicks or menu items–whatever suits your program.

You should also get your employer (if you work as a programmer) or your school, if any, to sign a "copyright disclaimer" for the program, if necessary. Here is a sample; alter the names:

Yoyodyne, Inc., hereby disclaims all copyright interest in the program `Gnomovision' (which makes passes at compilers) written by James Hacker.

<signature of Ty Coon>, 1 April 1989 Ty Coon, President of Vice

This General Public License does not permit incorporating your program into proprietary programs. If your program is a subroutine library, you may consider it more useful to permit linking proprietary applications with the library. If this is what you want to do, use the GNU Lesser General
Public License instead of this License.

PCRE - Perl Compatible Regular Expressions

PCRE2 LICENCE
-------------
PCRE2 is a library of functions to support regular expressions whose syntax and semantics are as close as possible to those of the Perl 5 language.
Release 10 of PCRE2 is distributed under the terms of the "BSD" licence, as specified below. The documentation for PCRE2, supplied in the "doc" directory, is distributed under the same terms as the software itself. The data in the testdata directory is not copyrighted and is in the public domain.
The basic library functions are written in C and are freestanding. Also included in the distribution is a just-in-time compiler that can be used to optimize pattern matching. This is an optional feature that can be omitted when the library is built.
